

## Chapter 14 : STATISTICS

The three measures of central tendency are :

- i. Mean
- ii. Median
- iii. Mode

• Mean Of grouped frequency distribution can be calculated by the following methods.

### Direct Method

### Direct Method

Where  $X_i$  is the class mark of the  $i$ th class interval and  $f_i$  frequency of that class

### Assumed Mean method or Shortcut method

Where  $a$  = assumed mean

And  $d_j = X_j - a$

### Step deviation method

### Step deviation method

Where  $a$  = assumed mean

$h$  = class size

And  $u_j = (X_j - a)/h$

• Median of a grouped frequency distribution can be calculated by

Where

$l$  = lower limit of median class

$n$  = number of observations

$cf$  = cumulative frequency of class preceding the median class

$f$  = frequency of median class

$h$  = class size of the median class.

• Mode of grouped data can be calculated by the following formula.

Where

$l$  = lower limit of modal class

$h$  = size of class interval

$f_1$  = Frequency of the modal class

$f_0$  = frequency of class preceding the modal class

$f_2$  = frequency of class succeeding the modal class

• Empirical relationship between the three measures of central tendency.

$3 \text{ Median} = \text{Mode} + 2 \text{ Mean}$

Or,  $\text{Mode} = 3 \text{ Median} - 2 \text{ Mean}$

• Ogive

Ogive is the graphical representation of the cumulative frequency distribution. It is of two types:

(i) Less than type ogive.

(ii) More than type ogive

• Median by graphical method

The x-coordinated of the point of intersection of 'less than ogive' and 'more than ogive' gives the median.
