

DISTANCE versus **DISPLACEMENT**

CHAPTER

4

Total length of path (ACB) covered by the particle is called distance. Displacement vector or displacement is the minimum distance (AB) and directed from initial position to final position.

Displacement is Change of Position Vector

From $\triangle OAB \quad \Delta \vec{r} = \vec{r}_B - \vec{r}_A$

$$\vec{\mathbf{r}}_{\rm B} = \mathbf{x}_2 \hat{\mathbf{i}} + \mathbf{y}_2 \hat{\mathbf{j}} + \mathbf{z}_2 \hat{\mathbf{k}}$$

 $\vec{\mathbf{r}}_{A} = \mathbf{x}_{1}\hat{\mathbf{i}} + \mathbf{y}_{1}\hat{\mathbf{j}} + \mathbf{z}_{1}\hat{\mathbf{k}}$

and

$$\Delta \vec{\mathbf{r}} = (\mathbf{x}_2 - \mathbf{x}_1)\hat{\mathbf{i}} + (\mathbf{y}_2 - \mathbf{y}_1)\hat{\mathbf{j}} + (\mathbf{z}_2 - \mathbf{z}_1)\hat{\mathbf{k}}$$

Average velocity = $\frac{\text{Displacement}}{\text{Time interval}} \Rightarrow \vec{v}_{av} = \frac{\Delta \vec{r}}{\Delta t}$

Average speed = $\frac{\text{Distance travelled}}{\text{Time interval}}$

For uniform motion

Average speed = | average velocity | = | instantaneous velocity |

Velocity
$$\vec{\mathbf{v}} = \frac{d\vec{\mathbf{r}}}{dt} = \frac{d}{dt} (x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) = \frac{dx}{dt}\hat{\mathbf{i}} + \frac{dy}{dt}\hat{\mathbf{j}} + \frac{dz}{dt}\hat{\mathbf{k}} = v_x\hat{\mathbf{i}} + v_y\hat{\mathbf{j}} + v_z\hat{\mathbf{k}}$$

Average Acceleration = $\frac{\text{Total change in velocity}}{\text{Total time taken}} = \vec{a}_{av} = \frac{\Delta \vec{v}}{\Delta t}$

Acceleration

$$\vec{a} = \frac{d\vec{v}}{dt} = \frac{d}{dt} (v_x \hat{i} + v_y \hat{j} + v_z \hat{k}) = \frac{dv_x}{dt} \hat{i} + \frac{dv_y}{dt} \hat{j} + \frac{dv_z}{dt} \hat{k} = a_x \hat{i} + a_y \hat{j} + a_z \hat{k}$$

Important Points About 1D Motion

- Distance \geq | displacement | and Average speed \geq | average velocity |
- If distance > | displacement | this implies

(a) atleast at one point in path, velocity is zero.

	Differentiation		Differentiation	
Displacement		Velocity		Acceleration
	Integration		Integration	

Motion with Constant Acceleration: Equations of Motion

• *In vector form:*

$$\vec{v} = \vec{u} + \vec{a}t$$
 and $\Delta \vec{r} = \vec{r}_2 - \vec{r}_1, \vec{s} = \left(\frac{\vec{u} + \vec{v}}{2}\right)t = \vec{u}t + \frac{1}{2}\vec{a}t^2 = \vec{v}t - \frac{1}{2}\vec{a}t^2$
 $v^2 = u^2 + 2\vec{a}.\vec{s}$ and $\vec{s}_{n^{th}} = \vec{u} + \frac{\vec{a}}{2}(2n-1)$

 $(S_{n^{th}} \rightarrow displacement in n^{th} second)$

• In scalar form (for one dimensional motion):

v = u + at
s =
$$\left(\frac{u+v}{2}\right)t = ut + \frac{1}{2}at^2 = vt - \frac{1}{2}at^2$$

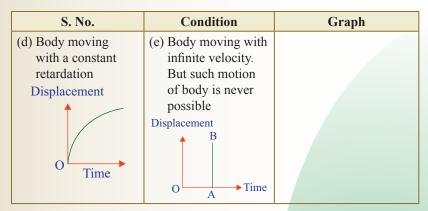

v² = u² + 2as $s_n = u + \frac{a}{2}(2n-1)$

UNIFORM MOTION

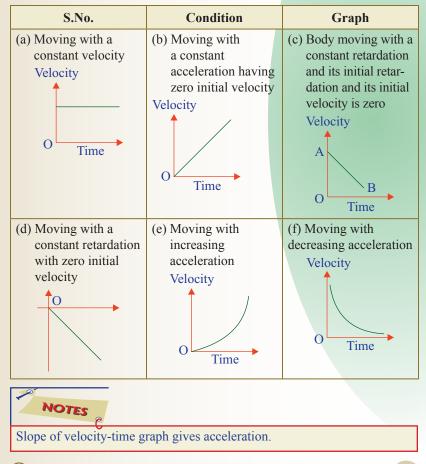

If an object is moving along the straight line covers equal distance in equal interval of time, it is said to be in uniform motion along a straight line.

DIFFERENT GRAPHS OF MOTION DISPLACEMENT-TIME GRAPH

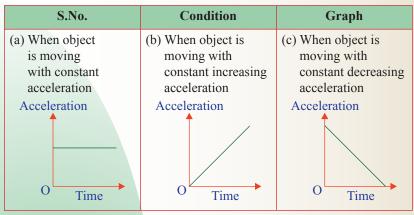

S. No.	Condition	Graph	
(a) For a stationary body	(b) Body moving with a constant velocity	(c) Body moving with a constant acceleration	
Displacement	Displacement	Displacement	
OTime	O Time	0 Time	

VELOCITY-TIME GRAPH

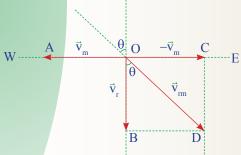

ACCELERATION-TIME GRAPH

RELATIVE MOTION

Relative Velocity of Rain w.r.t. the Moving Man

A man walking west with velocity \vec{v}_m , represented by \overrightarrow{OA} . Let the rain be falling vertically downwards with velocity \vec{v}_r , represented by \overrightarrow{OB} as shown in figure.

The relative velocity of rain w.r.t. man $\vec{v}_m = \vec{v}_r - \vec{v}_m$ will be represented by diagonal \overrightarrow{OD} of rectangle OBDC.

:.
$$v_{rm} = \sqrt{v_r^2 + v_m^2 + 2v_r v_m \cos 90^\circ} = \sqrt{v_r^2 + v_m^2}$$

If θ is the angle which \vec{v}_m makes with the vertical direction then

$$\tan \theta = \frac{BD}{OB} = \frac{v_{m}}{v_{r}} \Longrightarrow \theta = \tan^{-1} \left(\frac{v_{m}}{v_{r}} \right)$$

Swimming into the River

A man can swim with velocity \vec{v} , i.e., it is the velocity of man w.r.t. still water. If water is also flowing with velocity \vec{v}_R then velocity of man relative to ground $\vec{v}_m = \vec{v} + \vec{v}_R$.

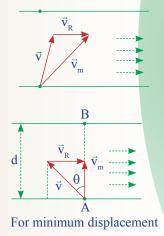

If the swimming is in the direction of flow of water or along the downstream then

If the swimming is in the direction opposite to the flow of water or along the upstream then

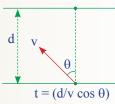

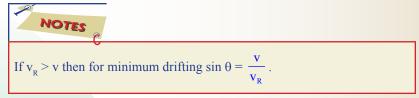

If man is crossing the river as shown in the figure i.e. \vec{v} and \vec{v}_{R} not collinear then use the vector algebra $\vec{v}_{m} = \vec{v} + \vec{v}_{R}$ (assuming $v > v_{R}$)

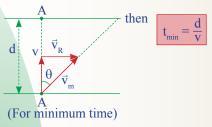

For shortest path

For minimum time

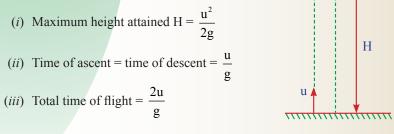

MOTION UNDER GRAVITY (No Air Resistance)

If an object is falling freely (u = 0) under gravity, then equations of motion becomes

(i)
$$v = u + gt$$
 (ii) $h = ut + \frac{1}{2}gt^2$ (iii) $v^2 = u^2 + 2gh$

If an object is thrown upward then g is replaced by -g in above three equations.

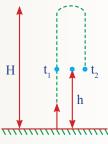

If a body is thrown vertically up with a velocity u in the uniform gravitational field then

- (*iv*) Velocity of fall at the point of projection = u (downwards)
- (v) **Gallileo's law of odd numbers:** For a freely falling body ratio of successive distance covered in equal time interval 't'

 $S_1: S_2: S_3: ..., S_n = 1: 3: 5: ..., 2n - 1$

At any point on its path the body will have same speed for upward journey and downward journey.

If a body thrown upwards crosses a point in time t_1 and t_2 respectively then height of point $h = \frac{1}{2} gt_1 t_2$. Maximum height $H = \frac{1}{8} g(t_1 + t_2)^2$.

A body is thrown upward, downward and horizontally with same speed takes time t_1 , t_2 and t_3 respectively to reach the ground then $t_3 = \sqrt{t_1 t_2}$ and height from where the particle was throw is $H = \frac{1}{2} gt_1 t_2$.

Vertical Motion of Projectile

 $v_y = u_y - gt$ where $u_y = u \sin \theta$; $y = u_y t - \frac{1}{2}gt^2 = u \sin \theta t - \frac{1}{2}gt^2$ Net acceleration $= \vec{a} = a_x\hat{i} + a_y\hat{j} = -g\hat{j}$

At any Instant

 $v_x = u \cos \theta$, $v_y = u \sin \theta - gt$

For Projectile Motion

A body crosses two points at same height in time t_1 and t_2 the points are at distance x and y from starting point then

(d) Average velocity from A to B is $u \cos \theta$

If a person can throw a ball to a maximum distance 'x' then the maximum height to which he can throw the ball will be (x/2).

Velocity of Particle at Time t

$$\vec{\mathbf{v}} = \mathbf{v}_x \hat{\mathbf{i}} + \mathbf{v}_y \hat{\mathbf{j}} = \mathbf{u}_x \hat{\mathbf{i}} + (\mathbf{u}_y - \mathbf{gt})\hat{\mathbf{j}} = \mathbf{u}\cos\theta\hat{\mathbf{i}} + (\mathbf{u}\sin\theta - \mathbf{gt})\hat{\mathbf{j}}$$

If angle of velocity \vec{v} from horizontal is α , then

$$\tan \alpha = \frac{v_y}{v_x} = \frac{u_y - gt}{u_x} = \frac{u \sin \theta - gt}{u \cos \theta} = \tan \theta - \frac{gt}{u \cos \theta}$$
At highest point:

$$v_y = 0, v_x = u \cos \theta$$
Time of flight:

$$T = \frac{2u_y}{g} = \frac{2u \sin \theta}{g}$$
Horizontal range: $R = (u \cos \theta)T = \frac{2u^2 \sin \theta \cos \theta}{g} = \frac{u^2 \sin 2\theta}{g} = \frac{2u_x u_y}{g}$
It is same for q and $(90^\circ - \theta)$ and maximum for $\theta = 45^\circ$.
Maximum height:

$$H = \frac{u_y^2}{2g} = \frac{u^2 \sin^2 \theta}{2g} = \frac{1}{8}gT^2$$

$$\frac{H}{R} = \frac{1}{4}\tan \theta$$
