# THERMOCHEMISTRY

#### 1. INTRODUCTION

Thermochemistry deals with the energy changes involved in chemical reaction.

#### 2. TYPES OF REACTIONS

#### (i) Exothermic reactions :

These are the chemical reactions involving release of heat.

Examples :- Neutralisation reactions, combustion reactions, slaking of lime, etc.

#### (ii) Endothermic reactions :

These are the chemical reactions involving absorption of heat.

Examples :- Decomposition reactions, elemination reaction, etc.

#### (iii) Thermo neutral reactions :

These are chemical reaction in which heat is neither absorbed nor released.

e.g. 
$$\frac{1}{2}H_2(g) + aq. \rightarrow H^+(aq.)$$
;  $\Delta H^\circ = 0$ 

$$\operatorname{AgClO}_{2}(s) \longrightarrow \operatorname{Ag}(s) + \frac{1}{2}\operatorname{Cl}_{2}(g) + \operatorname{O}_{2}(g) ; \Delta \mathrm{H}^{\circ} = 0$$

The reason behind release or absorption of heat in the reaction may be defined as difference in internal energy, bond energy, enthalpy, etc.

For exothermic reaction :

(i) 
$$\sum U_{\text{Reactant}} > \sum U_{\text{Product}}$$

- (ii)  $\sum H_{\text{Reactant}} > \sum H_{\text{Product}}$
- (iii)  $\sum (BE)_{Reactant} < \sum (BE)_{Product}$

#### 3. REPRESENTATION OF HEAT INVOLVED IN REACTIONS

(i) Old convention :

Reactants  $\longrightarrow$  Products  $\stackrel{}{\underset{\text{Endo}}{\longrightarrow}} Exo$  [Q = heat lost]

(ii) Modern convention :

Reactants  $\longrightarrow$  Products  $\Delta H = \underbrace{+}_{Exo}^{Endo} [Q = heat gained]$ 

### 4. THERMO CHEMICAL EQUATION

It represents a balanced chemical reaction in which the physical state along with allotropic form of all the reaction components as well as heat involved in reaction, are given.

$$C_2H_5OH(\ell) + 3O_2(g) \longrightarrow 2CO_2(g) + 3H_2O(\ell)$$
;  $\Delta_rH^\circ = -1367 \text{ kJ/mol}$ 

The above equation decribes the combustion of liquid ethanol at constant temperature and pressure. The negative sign of enthalpy change indicates that this is an exothermic reaction.

The coefficients in a balanced thermochemical equation refer to the number of moles (never molecules) of reactants and products in the reaction. Per mole of  $\Delta_r H^\circ$  defines the mole of reaction. For above reaction per mole means per mole of  $C_2H_5OH(\ell)$ , per 3 moles of  $O_2(g)$ , per 2 moles of  $CO_2(g)$  and per 3 moles of  $H_2O(\ell)$ .

#### 5. ENTHALPY CHANGE OF REACTION OR REACTION ENTHALPY (A,H)

Enthalpy of reaction is defined as the quantity of heat evolved or absorbed when molar quantities of substances react completely in amounts represented by chemical equation, all components being maintained at same pressure and same temperature conditions.

For example :  $H_2(g) + Cl_2(g) \rightarrow 2HCl(g)$ ;  $\Delta_r H = -183.92 \text{ kJ}$ 

Thus, when one mole of gaseous hydrogen reacts completely with one mole of gaseous chlorine, 183.92 kJ of heat is evolved.

 $\Delta_{\rm r} H = \Sigma H_{\rm products} - \Sigma H_{\rm reactants} = [2 \times H_{\rm m}({\rm HCl}, g)] - [1 \times H_{\rm m}({\rm H}_2, g) + 1 \times H_{\rm m}({\rm Cl}, g)]$ where  $H_{\rm m}$  = molar enthalpy

#### 5.1 FACTORS AFFECTING HEAT OR ENTHALPY OF REACTION :

The enthalpy change of reaction ( $\Delta H$ ) depends upon the following factors :

(i) Physical state of the reactants and the products : The  $\Delta H$  of a reaction depends upon the physical states of reactants and products. For example, when hydrogen and oxygen gases combine to give liquid water, the heat of reaction is different than when they combine to form gaseous water at the same temperature and pressure.

$$H_2(g) + O_2(g) \rightarrow H_2O(\ell) ; \Delta H = -285.83 \text{ kJ}$$

$$H_2(g) + O_2(g) \rightarrow H_2O(g)$$
;  $\Delta H = -241.82 \text{ kJ}$ 

- (ii) Quantities of reaction components : The amount of heat evolved or absorbed depends upon the amount of components involved in the reaction. For example, the heat of combustion of 2 moles of carbon is double than heat of combustion of 1 mole of carbon.
- (iii) Allotropic forms : The amount of heat evolved or absorbed for different forms of the same substance are different. For example,

$$\begin{split} C(\text{diamond}) + \text{O}_2(\text{g}) &\rightarrow \text{CO}_2(\text{g}) \ ; \ \Delta \text{H} = -395.41 \text{ kJ} \\ C(\text{graphite}) + \text{O}_2(\text{g}) &\rightarrow \text{CO}_2(\text{g}) \ ; \ \Delta \text{H} = -393.51 \text{ kJ} \end{split}$$

ALLEN

(iv) **Temperature** : The heat of reaction depends upon the temperature of reactants and products.

$H_2O(\ell) \rightarrow H_2O(g)$	$\Delta H = x$ kcal at 298K
$H_2O(\ell) \rightarrow H_2O(g)$	$\Delta H = y$ kcal at 373K

The dependence of reaction enthalpy on temperature is given by Kirchoff's equation :

$$\Delta_{r}H_{2} - \Delta_{r}H_{1} = \int_{T_{1}}^{T_{2}} \Delta_{r}(C_{P}) \cdot dT \text{ and } \Delta_{r}U_{2} - \Delta_{r}U_{1} = \int_{T_{1}}^{T_{2}} \Delta_{r}(C_{V}) \cdot dT$$

However,  $\Delta_{\rm r}$  H and  $\Delta_{\rm r}$  U do not change significantly on changing the temperature.

(v) Measurement at constant pressure or volume : The heat of reaction depends upon the conditions of measurement of heat at constant pressure or volume, as,

$$\Delta_{\rm r} {\rm H} = \Delta_{\rm r} {\rm U} + \Delta_{\rm r} ({\rm PV})$$

ALLEN

node 06 \B0AI+B0 \Kata\LEE(Advanced)\Enthusicat\Chem\Sheet\Thermochemistry\Eng\01\_Theory.p65

Е

 $\Delta H$  may be equal, greater than or less than  $\Delta_r U$ .

For reaction involving gaseous components,

$$\Delta_{\mathbf{r}}\mathbf{H} = \Delta_{\mathbf{r}}\mathbf{U} + \Delta_{\mathbf{r}}\mathbf{n}_{\mathbf{g}} \cdot \mathbf{RT}$$

(vi) **Pressure :** Enthalpy of any component may depend on pressure and  $\Delta_r H$  may change on changing the pressure. As, the enthalpy of an ideal gas is independent from the change in pressure, for the reactions involving ideal gases,  $\Delta_r H$  is pressure independent.

#### EXERCISE # I

- 1. Consider the reaction :  $N_2 + 3H_2 \longrightarrow 2NH_3$  carried out at constant temperature and pressure, if  $\Delta H$ and  $\Delta U$  are the enthalpy and internal energy changes for the reaction, which of the following expressions is true ? [AIEEE-2005]
- (A)  $\Delta H = \Delta U$ (B)  $\Delta H = 0$ (C)  $\Delta H > \Delta U$ (D)  $\Delta H < \Delta U$ 2. For which reaction will  $\Delta H = \Delta U$ ? (B)  $C(s) + 2 H_2O(g) \rightarrow 2H_2(g) + CO_2(g)$ (A)  $H_2(g) + Br_2(g) \rightarrow 2 HBr(g)$ (D)  $2CO(g) + \tilde{O}_{2}(g) \rightarrow 2\tilde{CO}_{2}(g)$ (C)  $PCl_{\epsilon}(g) \rightarrow PCl_{\epsilon}(g) + Cl_{\epsilon}(g)$ For which of the following change  $\Delta H \neq \Delta U$ ? 3.  $(A) \operatorname{H}_{2}(g) + \operatorname{I}_{2}(g) \longrightarrow 2HI(g)$ (B) HCl (aq)+NaOH(aq)  $\longrightarrow$  NaCl(aq) + H<sub>2</sub>O(l) (C) C(s) +  $O_2(g) \longrightarrow CO_2(g)$ (D)  $N_2(g) + 3H_2(g) \longrightarrow 2NH_3(g)$

4. A mixture of 2 moles of carbon monoxide and one mole of oxygen in a closed vessel is ignited to get carbon dioxide. If  $\Delta$  H is the enthalpy change and  $\Delta$ U is the change in internal energy, then :-

	(A) $\Delta$ H > $\Delta$ U	(B) $\Delta$ H < $\Delta$ U	(C) $\Delta$ H = $\Delta$ U	(D) Not definite
5.	For the reaction : $N_2(g)$	$+ 3H_2(g) \longrightarrow 2N_2(g)$	$\operatorname{H}_3(\mathbf{g}), \Delta \mathbf{H} \text{ is } -$	
	(A) $\Delta$ U + 2RT	(B) $\Delta U - 2RT$	$(C) \Delta U + RT$	$(D) \Delta U - RT$

6. When the following reaction was carried out in a bomb calorimeter,  $\Delta U$  is found to be -742.7 kJ/mol of NH<sub>2</sub>CN(s) at 300 K.

$$NH_2CN(s) + \frac{3}{2}O_2(g) \longrightarrow N_2(g) + CO_2(g) + H_2O(l)$$
  
Calculate  $\Delta H_{300K}$  for the reaction. (R = 8 J/mole-K).

3

## 7. For the reaction : $2A(g) + 3B(g) \longrightarrow 4C(g) + D(\ell)$ ; $\Delta H = -20$ KJ/mole

Find the heat exchanged when 0.4 mole of A reacts with excess of B in a closed rigid container. The temperature is constant at 300 K. [R=8.3 J/K mole]

#### 5.2 MEASUREMENT OF $\Delta U$ AND $\Delta H$ : CALORIMETRY :

We can measure energy changes associated with chemical or physical processes by an experimental technique called calorimetry. In calorimetry, the process is carried out in a vessel called calorimeter, which is immersed in a known volume of a liquid. Knowing the heat capacity of the liquid in which calorimeter is immersed and the heat capacity of calorimeter, it is possible to determine the heat evolved in the process by measuring temperature changes. Measurements are made under two different conditions:

- (i) at constant volume,  $q_V$
- (ii) at constant pressure,  $q_p$
- (a)  $\Delta U$  measurements : For chemical reactions, heat absorbed at constant volume, is measured in a bomb calorimeter (Figure). Here, a steel vessel (the bomb) is immersed in a water bath. The whole device is called calorimeter. The steel vessel is immersed in water bath to ensure that no heat is lost to the surroundings. A combustible substance is burnt in pure dioxygen supplied in the steel bomb. Heat evolved during the reaction is transferred to the water around the bomb and its temperature is monitored. Since the bomb calorimeter is sealed, its volume does not change i.e., the energy changes associated with reactions are measured at constant volume. Under these conditions, no work is

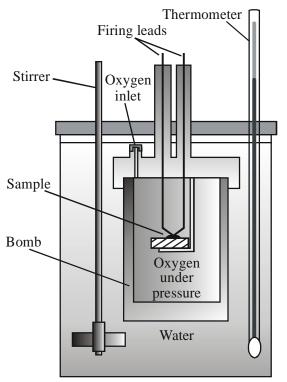

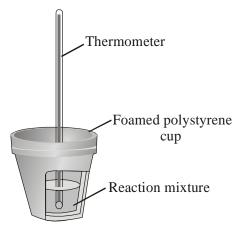

Figure : Bomb calorimeter

done as the reaction is carried out at constant volume in the bomb calorimeter. Even for reactions involving gases, there is no work done as  $\Delta V = 0$ . Temperature change of the calorimeter produced by the completed reaction is then converted to  $q_V$ , by using the known heat capacity of the calorimeter with the help of equation 6.11.

(b)  $\Delta H$  measurements : Measurement of heat change at constant pressure (generally under atmospheric pressure) can be done in a calorimeter shown in figure. We know that  $\Delta H = q_p$  (at constant p) and, therefore, heat absorbed or evolved,  $q_p$  at constant pressure is also called the heat of reaction or enthalpy of reaction,  $\Delta_r H$ .

In an exothermic reaction, heat is evolved, and system loses heat to the surroundings. Therefore,  $q_p$  will be negative and  $\Delta_r H$  will also be negative. Similarly in an endothermic reaction, heat is absorbed,  $q_p$  is positive and  $\Delta_r H$  will be positive.

**Figure :** Calorimeter for measuring heat changes at constant pressure (atmospheric pressure)

*Ex.1.* 1g of graphite is burnt in a bomb calorimeter in excess of oxygen at 298 K and 1 atmospheric pressure according to the equation

 $C(graphite) + O_2(g) \rightarrow CO_2(g)$ 

During the reaction, temperature rises from 298 K to 299 K. If the heat capacity of the bomb calorimeter is 20.7kJ/K, what is the enthalpy change for the above reaction at 298 K and 1 atm?

*Sol.* : Suppose q is the quantity of heat from the reaction mixture and  $C_V$  is the heat capacity of the calorimeter, then the quantity of heat absorbed by the calorimeter.

 $q = C_V \Delta T$ 

Quantity of heat from the reaction will have the same magnitude but opposite sign because the heat lost by the system (reaction mixture) is equal to the heat gained by the calorimeter.

$$q = -C_V \times \Delta T = -20.7 \ kJ/K \times (299 - 298)K = -20.7 \ kJ$$

(Here, negative sign indicates the exothermic nature of the reaction)

Thus,  $\Delta U$  for the combustion of the 1g of graphite = -20.7 kJ

For combustion of 1 mol of graphite,

 $\Delta H = \Delta U = \frac{12.0 \text{g mol}^{-1} \times (-20.7 \text{kJ})}{1 \text{g}} = -2.48 \times 10^2 \text{kJ.mol}^{-1}, \quad Since \ \Delta n_g = 0$ 

#### EXERCISE # II

- 8. One gm sample of  $NH_4NO_3(s)$  is decomposed in a bomb calorimeter (constant volume). The temperature of the calorimeter system falls by 6K. If the heat capacity of system is 1.25 kJ/K, what is the molar enthalpy of decomposition of  $NH_4NO_3(s)$  at 300 K. [R = 8.3 JK<sup>-1</sup> mol<sup>-1</sup>].  $NH_4NO_3(s) \rightarrow N_2O(g) + 2H_2O(l)$ .
- **9.** 0.16 g of methane was subjected to combustion at 27°C in a bomb Calorimeter . The temperature of Calorimeter system (including water) was found to rise by 0.5°C . Calculate the heat of combustion of methane at

(i) constant volume (ii) constant pressure .

The thermal capacity of Calorimeter system is 17.7 kJ  $K^{-1}$ . (R = 8.313 mol<sup>-1</sup>  $K^{-1}$ )

10. If 1.22 gm of benzoic acid gives off 31.723 J of energy when burned in bomb calorimeter in the presence of excess oxygen at an initial temperature of 24.6°C. Calculate, W and  $\Delta U$  for the given amount of benzoic acid in the calorimeter, assuming ideal gas behaviour.

## 6. STANDARD ENTHALPY OF REACTION, $\Delta H^{\circ}$

Enthalpy of a reaction depends on the conditions under which a reaction is carried out. It is, therefore, necessary that we must specify some standard conditions. The standard enthalpy of reaction is the enthalpy change for a reaction when all the participating substances are in their standard states.

**The standard state of a substance at a specified temperature is its pure form at 1 bar.** For example, the standard state of liquid ethanol at 298 K is pure liquid ethanol at 1 bar; standard state of solid iron at 500 K is pure iron at 1 bar. Usually data are taken at 298 K.

Standard conditions are denoted by adding the superscript  $\Theta$  to the symbol  $\Delta H$ , e.g.,  $\Delta H^{\Theta}$ 

## 7. SOME DIFFERENT KINDS OF $\Delta_r H^{\Theta}$ :

## 7.1 STANDARD ENTHALPY OF FORMATION, $\Delta_r H^{\circ}$ :

The standard enthalpy change for the formation of one mole of a compound from its elements in their most stable states of aggregation (also known as reference states) is called Standard Molar Enthalpy of Formation. The reference state of an element is its most stable state of aggregation at  $25^{\circ}$  C and 1 bar pressure. For example, the reference state of dihydrogen is H<sub>2</sub> gas and those of dioxygen, carbon and sulphur are O<sub>2</sub> gas, C<sub>graphite</sub> and S<sub>rhombic</sub> respectively. Some reactions with standard molar enthalpies of formation are given below.

## ALLEN

$$\begin{split} H_{2}(g) + & O_{2}(g) \rightarrow H_{2}O(A) \quad ; & \Delta_{f}H^{\Theta} = -285.8 \text{ kJ mol}^{-1} \\ C \text{ (graphite, s)} + 2H_{2}(g) \rightarrow CH_{4}(g) \text{ ; } & \Delta_{f}H^{\Theta} = -74.81 \text{ kJ mol}^{-1} \\ 2C \text{ (graphite, s)} + 3H_{2}(g) + & O_{2}(g) \rightarrow C_{2}H_{5}OH(A) \quad ; \Delta_{f}H^{\Theta} = -277.7 \text{ kJ mol}^{-1} \end{split}$$

It is important to understand that a standard molar enthalpy of formation,  $\Delta_f H^{\Theta}$ , is just a special case of  $\Delta_r H^{\Theta}$ , where one mole of a compound is formed from its constituent elements, as in the above three equations, where 1 mol of each, water, methane and ethanol is formed. In contrast, the enthalpy change for an exothermic reaction:

 $CaO(s) + CO_2(g) \rightarrow CaCO_3(s)$ ;  $\Delta_r H^{\Theta} = -178.3 \text{kJ mol}^{-1}$ 

is not an enthalpy of formation of calcium carbonate, since calcium carbonate has been formed from other compounds, and not from its constituent elements. Also, for the reaction given below, enthalpy change is not standard enthalpy of formation,  $\Delta_r H^{\Theta}$  for HBr(g).

 $H_2(g) + Br_2(l) \rightarrow 2HBr(g)$ ;  $\Delta_f H^{\Theta} = -72.8 \text{ kJ mol}^{-1}$ 

Here two moles, instead of one mole of the product is formed from the elements, i.e.,

 $\Delta_{\rm r} {\rm H}^{\Theta} = 2 \Delta_{\rm f} {\rm H}^{\Theta}$ 

Therefore, by dividing all coefficients in the balanced equation by 2, expression for enthalpy of formation of HBr (g) is written as

$$H_2(g) + Br_2(A) \rightarrow HBr(g)$$
;  $\Delta_f H^{\Theta} = -36.4 \text{ kJ mol}^{-1}$ 

(i)  $\Delta_{\rm f} {\rm H}^{\circ} = 0$  for all the elements in their reference state.

(ii) Standard enthalpy of reaction from standard enthalpy of formation : The knowledge of standard enthalpy of formation of various substances can be used to calculate the standard enthalpy of reactions under standard conditions. The standard enthalpy of any reaction ( $\Delta H^\circ$ ) is equal to the difference between the  $\Delta_r H^\circ$  of all the products and the reactants.

 $\Delta H^{\circ}$  = Sum of the standard enthalpy of formation of products - Sum of the standard enthalpy of formation of reactants.

i.e., 
$$\Delta_{\mathbf{r}} \mathbf{H}^{o} = \Sigma \Delta_{\mathbf{f}} \mathbf{H}^{o}_{(\mathbf{products})} - \Sigma \Delta_{\mathbf{f}} \mathbf{H}^{o}_{(\mathbf{reactants})}$$
  
For a reaction,  $\mathbf{aA} + \mathbf{bB} \rightarrow \mathbf{cC} + \mathbf{dD}$   
 $\Delta_{\mathbf{r}} \mathbf{H}^{o} = \Sigma \Delta_{\mathbf{f}} \mathbf{H}^{o}_{(\mathbf{products})} - \Sigma \Delta_{\mathbf{f}} \mathbf{H}^{o}_{(\mathbf{reactants})}$   
 $= [\mathbf{c} \Lambda \mathbf{H}^{o} (\mathbf{C}) + \mathbf{d} \Lambda \mathbf{H}^{o} (\mathbf{D})] - [\mathbf{a} \Lambda \mathbf{H}^{o} (\mathbf{A}) + \mathbf{b} \Lambda \mathbf{H}^{o} (\mathbf{B})]$ 

**Ex.2.** Standard enthalpies of formation of CO(g),  $CO_2(g)$ ,  $N_2O(g)$  and  $N_2O_4(g)$  are -110, -393, -81 and 10 kJ/moe, respectively. Find the  $\Delta_r H^\circ$  for the reaction :

$$N_2O_4(g) + 3CO \longrightarrow N_2O(g) + 3CO_2(g)$$

Sol.: 
$$\Delta_{\rm r} {\rm H}^{\rm o} = \Sigma \Delta_{\rm f} {\rm H}^{\rm o}_{\rm (products)} - \Sigma \Delta_{\rm f} {\rm H}^{\rm o}_{\rm (reactants)}$$
$$= \left[ \Delta_{f} {\rm H}^{\rm o}_{N_{2}O(g)} + 3 \times \Delta_{f} {\rm H}^{\rm o}_{CO_{2}(g)} \right] - \left[ \Delta_{f} {\rm H}^{\rm o}_{N_{2}O_{4}(g)} + 3 \times \Delta_{f} {\rm H}^{\rm o}_{CO(g)} \right]$$
$$= \left[ 81 + 3 \times (-3393) \right] - \left[ 10 + 3 \times (-110) \right] = -778 \text{ kJ/mol.}$$

7

Hence

#### 7.2 STANDARD ENTHALPY OF COMBUSTION, $\Delta_{c}H^{\oplus}$ :

Standard enthalpy of combustion is defined as the enthalpy change per mole (or per unit amount) of a substance, when it undergoes combustion and all the **reactants and products** being in their standard states at the specified temperature.

For example, the standard enthalpy of combustion of methane at 298.15 K is  $-890.36 \text{ kJ mol}^{-1}$ . This implies the following reaction :

$$CH_4(g) + 2O_2(g) \rightarrow CO_2(g) + 2H_2O(\ell)$$
;  $\Delta H^\circ = -890.36 \text{ kJ mol}^{-1}$ 

The standard enthalpy of combustion of methane at 298.15 K may be writen as

$$\Delta_{c} H^{\circ}(CH_{4}, g, 298.15 \text{ K}) = -890.36 \text{ kJ mol}^{-1}$$

**7.2.1 Application of enthalpy of combustion :** Consider a reaction of decomposition of  $C_6H_{14}$  into  $C_4H_8$  and  $C_2H_6$ . The following diagram show how enthalpy of combustions can be used to estimate enthalpy of reaction.

$$C_{6}H_{14}(g) \xrightarrow{\Delta_{1}H} C_{4}H_{8} + C_{2}H_{6}$$

$$+ 9.5O_{2}(g) + 3.5O_{2}(g)$$

$$\Delta H_{combustion}(C_{6}H_{14}) \qquad \Delta H_{combustion}(C_{4}H_{8})$$

$$+ 6CO_{2}(g) + 7H_{2}O(l)$$

From the inspection of the above diagram, it is clear that

$$\Delta H_{\text{reaction}} = \Delta H_{\text{combustion}}(C_6 H_{14}) - \Delta H_{\text{combustion}}(C_4 H_8) - \Delta H_{\text{combustion}}(C_2 H_6)$$
$$\Delta_r H = \Sigma \Delta_c H(\text{Reactants}) - \Sigma \Delta_c H (\text{Products})$$

*Ex.3.* Calculate the standard enthalpy of formation of carbon disulphide ( $\ell$ ). Given that the standard enthalpies of combustion of carbon (s) sulphur (s) and carbon disulphide ( $\ell$ ) are 393.3, -293.72 and -1108.76kJ mol<sup>-1</sup> respectively.

Sol: 
$$C(s) + 2S(s) \longrightarrow CS_2(\ell)$$
;  $\Delta_f H^{\circ}_{(CS_2(\ell))} = ?$   
Now,  $\Delta_r H^{\circ} = \Sigma \Delta_c H^{\circ}_{(Reactants)} - \Sigma \Delta_c H^{\circ}_{(Products)}$   
 $= \left[ \Delta_c H^{\circ}_{C(s)} + 2 \times \Delta_c H^{\circ}_{S(s)} \right] - \left[ \Delta_c H^{\circ}_{CS_2(\ell)} \right]$   
 $= \left[ (-393.3) + 2 \times (-293.72] - \left[ -1108.76 \right] \right]$   
 $= -128.02 \ kJ/mol$

## 7.3 BOND ENTHALPY, $\Delta_{bond} H^{\Theta}$ :

Chemical reactions involve the breaking and making of chemical bonds. Energy is required to break a bond and energy is released when a bond is formed. It is possible to relate heat of reaction to changes in energy associated with breaking and making of chemical bonds. With reference to the enthalpy changes associated with chemical bonds, two different terms are used in thermodynamics.

(i) Bond dissociation enthalpy

(ii) Mean bond enthalpy

Let us discuss these terms with reference to diatomic and polyatomic molecules.

*Diatomic Molecules:* Consider the following process in which the bonds in one mole of dihydrogen gas  $(H_2)$  are broken:

$$H_2(g) \rightarrow 2H(g)$$
;  $\Delta_{H-H}H^{\Theta} = 435.0 \text{ kJ mol}^{-1}$ 

The enthalpy change involved in this process is the bond dissociation enthalpy of H–H bond. The bond dissociation enthalpy is the change in enthalpy when one mole of covalent bonds of a gaseous covalent compound is broken to form products in the gas phase.

Note that it is the same as the enthalpy of atomization of dihydrogen. This is true for all diatomic molecules. For example:

$$\operatorname{Cl}_2 g$$
)  $\rightarrow 2\operatorname{Cl}(g)$ ;  $\Delta_{\operatorname{Cl-Cl}} H^{\Theta} = 242 \text{ kJ mol}^{-1}$ 

$$O_2(g) \rightarrow 2O(g)$$
;  $\Delta_{O=O} H^{\Theta} = 428 \text{ kJ mol}^{-1}$ 

In the case of polyatomic molecules, bond dissociation enthalpy is different for different bonds within the same molecule.

*Polyatomic Molecules:* Let us now consider a polyatomic molecule like methane,  $CH_4$ . The overall thermochemical equation for its atomization reaction is given below:

$$CH_4(g) \rightarrow C(g) + 4H(g); \Delta_a H^{\Theta} = 1665 \text{ kJ mol}^-$$

In methane, all the four C - H bonds are identical in bond length and energy. However, the energies required to break the individual C - H bonds in each successive step differ :

$$CH_4(g) \rightarrow CH_3(g) + Hl(g)$$
;  $\Delta_{bond} H^{\Theta} = +427 \text{ kJ mol}^{-1}$ 

$$CH_3(g) \rightarrow CH_2(g) + H(g) ; \Delta_{bond} H^{\Theta} = +439 \text{ kJ mol}^{-1}$$

$$CH_2(g) \rightarrow CH(g) + H(g) ; \Delta_{bond} H^{\Theta} = +452 \text{ kJ mol}^{-1}$$

 $CH(g) \rightarrow C(g) + H(g)$ ;  $\Delta_{bond} H^{\Theta} = + 347 \text{ kJ mol}^{-1}$ 

Therefore,

$$CH_4(g) \rightarrow C(g) + 4H(g)$$
;  $\Delta_a H^{\Theta} = 1665 \text{ kJ mol}^{-1}$ 

In such cases we use **mean bond enthalpy of C – H bond.** 

For example in  $CH_4$ ,  $\Delta_{C-H}H^{\Theta}$  is calculated as:

$$\Delta_{C-H} H^{\Theta} = \frac{1}{4} (\Delta_a H^{\Theta}) = \frac{1}{4} (1665 \text{ kJ mol}^{-1}) = 416 \text{ kJ mol}^{-1}$$

We find that mean C–H bond enthalpy in methane is 416 kJ/mol. It has been found that mean C–H bond enthalpies differ slightly from compound to compound, as in  $CH_3CH_2Cl$ ,  $CH_3NO_2$ , etc, but it does not differ in a great deal. Using Hess's law, bond enthalpies can be calculated.

ALLEN

## ALLEN

- (i) Mean bond enthalpy may be used to calculate  $\Delta_{r}H$  of gaseous reaction : Reactants (R, g)  $\longrightarrow$  Products (P, g), as R(g)  $\rightarrow$  gaseous atoms A(g) ;  $\sum \Delta_{Bond}H_{R} = H_{A} - H_{R}$ P(g)  $\rightarrow A(g)$  ;  $\sum \Delta_{Bond}H_{p} = H_{A} - H_{P}$   $\Delta_{r}H = H_{P} - H_{R} = \sum \Delta_{bond}H_{R} - \sum \Delta_{bond}H_{P}$   $\Delta_{r}H = \sum \Delta_{bond}H_{Reactants} - \sum \Delta_{bond}H_{Poroducts}$ 
  - (ii) If physical state of any component is different than gaseous, then it should be converted into gaseous atom.
  - (iii)  $\Delta H$  calculated from bond enthalpy give  $\Delta_r H_{theo}$  because mean enthalphies are used in place of bond dissociation enthalpies. Normally it remain very close to experimental  $\Delta_r H$  but if any reaction component is more or less stable by any effect like resonance, hyperconjugation, strain, etc, the value differs largely. The difference is called energy or enthalpy of the kind responsible for the difference like resonance energy, strain energy, etc. It is given by

$$\Delta_{\rm r} {\rm H}_{\rm exp} - \Delta_{\rm r} {\rm H}_{\rm theo} = \Delta {\rm H}_{\rm effect}$$

- **Ex.4.** If  $E_{c-c}$  is 344 kJ mol<sup>-1</sup> and  $E_{c-H}$  is 415 kJ mol<sup>-1</sup>, calculate the enthalpy of formation of propane. The enthalpies of atomization of carbon(s) and hydrogen (g) are 716 kJ mole<sup>-1</sup> and 433 kJ mole<sup>-1</sup> respectively.
- *Sol.*: The enthalpy of formation is the sum of the atomization and bond energies. For propane, the enthalpies of atomization are

 $3C(s) \longrightarrow 3C(g) ; \Delta H = 3 \times 716 = 2148 \text{ kJ}$   $4H_2(g) \longrightarrow 8H(g) ; \Delta H = 4 \times 433 = 1732 \text{ kJ}$ The bond enthalpies are  $2E_{C-C} = 2 \times -344 = -688 \text{ kJ}$   $8E_{C-H} = 8 \times -415 = -3320 \text{ kJ}$ Adding  $3C + 4H_2 \longrightarrow C_3H_8 ; \Delta H_f = 2148 + 1732 - 688 - 3320 = -128 \text{ kJ mole}^{-1}$

## Thermochemistry

#### ALLEN \_\_\_\_\_

- 31  $\operatorname{XeF}_{2}(g) + \operatorname{H}_{2}(g) \rightarrow 2\operatorname{HF}(g) + \operatorname{Xe}(g)$ ;  $\Delta \operatorname{H}^{\circ} = -430 \text{ kJ}$ using the following bond energies:  $\operatorname{H}-\operatorname{H} = 435 \text{ kJ/mol}, \operatorname{H}-\operatorname{F} = 565 \text{ kJ/mol}$ Calculate the average bond energy of Xe-F in XeF<sub>2</sub>.
- 32 Using the given data calculate enthalpy of formation of acetone (g). [All values in kJ mol<sup>-1</sup>] Bond enthalpy of :

C - H = 415; C - C = 350; (C = O) = 730(O = O) = 495.0 ; H - H = 435;  $\Delta_{sub}H$  of C = 720

# 7.4 ENTHALPY OF NEUTRALISATION, $\Delta_{neut} H^{\circ}$ :

The reaction in which an acid and a base react to give a salt and water is called neutralization reaction. Neutralization reactions are exothermic in nature. The enthalpy change when one gram equivalent of an acid and one gram equivalent of a base neutralise each other completely in dilute aqueous solution, is called enthalpy of neutralization.

For examples :

- (i) Neutralization of HCl with NaOH HCl(aq) + NaOH(aq)  $\longrightarrow$  NaCl(aq) + H<sub>2</sub>O( $\ell$ ) ;  $\Delta_{neut}$ H = -57.1 kJ
- (ii) Neutralization of CH<sub>3</sub>COOH with NaOH CH<sub>3</sub>COOH(aq) + NaOH(aq)  $\longrightarrow$  CH<sub>3</sub>COONa + H<sub>2</sub>O( $\ell$ );  $\Delta_{neut}$ H = -55.9 kJ

It is important to note that the term gram equivalent is used in the definition of heat of neutralization. This is because neutralization involves 1 mole of  $H^+$  ions and 1 mole of  $OH^-$  ions to form 1 mole of water and 57.1 kJ of heat is liberated.

 $H^{+}(aq) + OH^{-} \longrightarrow H_2O(\ell)$ ;  $\Delta_{neut}H = -57.1 kJ$ 

Now, one gram equivalent of various acids on complete dissociation liberates one mole of  $H^+$  ions. But one mole of the acid may produce more than one mole of  $H^+$  ions in solution depending upon its basicity; for example 1mol of  $H_2SO_4$  gives 2 mol of  $H^+$  ions and 1mol of  $H_3PO_4$  gives 3 mol of  $H^+$  ions on complete dissociation. But 1 gram equivalent of both ( $H_2SO_4$  or  $H_3PO_4$ ) produces only 1 mol of  $H^+$  ions. Thus, it is more appropriate to use the term gram equivalent in the definition of enthalpy of neutralization.

The average enthalpy of neutralization of any strong acid by a strong base is found to be -57.1 kJ/eq. This is because strong acids and strong bases are completely ionized in aqueous solutions. The aqueous solution of one gram equivalent of all strong acids contain the same number of H<sup>+</sup> ions. Similarly, aqueous solution of one gram equivalent of all strong bases also contain same number of OH<sup>-</sup>. The neutralization reactions between strong acids and strong bases in aqueous solutions involve simply the combination of H<sup>+</sup> ions (from an acid) and OH<sup>-</sup> ions (from a base) to form unionized water molecules. For example, the reaction between hydrochloric acid and sodium hydroxide. The neutralization can be represented as :

 $H^+(aq) + Cl^-(aq) + Na^+(aq) + OH^-(aq) → Na^+(aq) Cl^-(aq) + H_2O(\ell)$ ; ΔH = -57.1 kJ Cancelling common ions :

 $H^{+}(aq) + OH^{-}(aq) \longrightarrow H_2O(\ell)$ ;  $\Delta H = -57.1 \text{ kJ}$ 

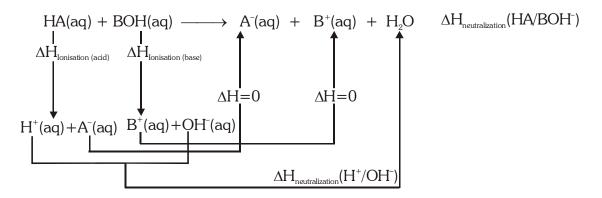

(i	) $\Delta_{neut}$ H for any strong acid by any strong base is almost constant.
	$\Delta_{\text{neut}} \Delta(\text{H}^+/\text{OH}^-) = -57.1 \text{ kJ/mole}^{-1} = -13.7 \text{ kcal mol}^{-1}$
	It is due to the only enthalpy change occuring in such process which is
	$H^+(aq.) + OH^-(aq) \rightarrow H_2O(l)$ ; $\Delta H^\circ = -13.7$ kcal/eq.
(i	i) If any of the acid or base is weak, the numerical value of $\Delta_{neut}$ H decreases from 13.7 kcal by
	enthalpy of ionization for the weak component. The weak component is assumed completely
	unionised in solution.
<i>Ex5</i> .	The acids HA, HB & HC are neutralised seperately by NaOH. If $\Delta_{neut}$ H are -12.1, -3.9
	& -7.2 kcal/eq. Arrange the acids in the increasing order of their acidic strength.
Sol:	A > C > B
<i>Ex.6</i> .	$\Delta_{neut}H$ of $H_2C_2O_4$ by NaOH is -8.7 kcal/mol, $\Delta_{ion}H$ of oxalic acid is
Sol :	$-27.4 + H_{ion} = -8.7$
	$\therefore \Delta_{ion}H = +18.7 \ kcal/mol$

**7.4.1 The enthalpy of neutralization of weak acid and weak base :** Consider the neutralisation of weak acid HA with weak base BOH.

Where,  $\Delta H_{\text{ionisation}}$  (HA) = Enthalpy of ionization of acid HA = Enthalpy to ionize 1 mole of weak acid in aq. soln.

 $\Delta H_{\text{ionisation}}$  (BOH) = Enthalpy of ionization of base BOH

 $\Delta H_{neutralisation}$  (H<sup>+</sup>/OH) = Enthalpy change for the reaction of H<sup>+</sup> and OH<sup>-</sup> to form water.

Thus for weak acid :

 $\Delta H_{neut}(BOH/HA) = \Delta H_{ion}(HA) + \Delta H_{ion}(BOH) + \Delta H_{neut}(H^+/OH^-)$ 

#### EXERCISE # V

- **33.** Calculate the enthalpy of ionisation of weak acid  $H_2A(H_2A \rightarrow 2H^+ + A^{2-})$  in Kcal/ mol, if enthalpies of neutralisation of HCl and  $H_2A$  by a strong base are -14 Kcal/eq and -11 Kcal/eq respectively.
- **34.** Enthalpy of neutralization of  $H_3PO_3$  acid is -106.68 kJ/mol using NaOH. If enthalpy of neutralization of<br/>HCl by NaOH is -55.84 kJ/mol. Calculate  $\Delta H_{ionization}$  of  $H_3PO_3$  into its ions<br/>(A) 50.84 kJ/mol(B) 5 kJ/mol(C) 2.5 kJ/mol(D) 60.84 kJ/mol

iistry/Eng\01\_Theory.

## 7.5 ENTHALPY OF SOLUTION, $\Delta_{sol} H^{\Theta}$ :

ALLEN \_\_\_\_\_

When a solute is dissolved in a solvent, a solution is formed. During dissolution of a solute in any solvent, a certain amount of heat is either absorbed or evolved. The change in enthalpy when one mole of a solute is dissolved in a specified quantity of a solvent at a given temperature is called enthalpy of solution. To avoid the amount of solvent, enthalpy of solution is usually defined for an infinite dilute solution. Thus, enthalpy of solution at infinite dilution is the enthalpy change when one mole of a substance is dissolved in such a large quantity of solvent so that further dilution does not give any further enthalpy change.

 $\text{KCl}(s) + \text{aq.} \longrightarrow \text{KCl}(\text{aq}) ; \Delta_{\text{sol}}\text{H} = +18.6 \text{kJ mol}^{-1}$ 

$$CaCl_2(s) + aq. \longrightarrow KCl(aq) ; \Delta_{sol}H = -75.3 kJ mol^{-1}$$

When an ionic compound dissolves in a solvent, the ions leave their ordered positions on the crystal lattice. These are now more free in solution. But solvation of these ions (hydration in case solvent is water) also occurs at the same time. This is shown diagrammatically, for an ionic compound, AB (s)

The enthalpy of solution of AB(s),  $\Delta_{sol}H^{\Theta}$ , in water is, therefore, determined by the selective values of the lattice enthalpy,  $\Delta_{lattice}H^{\Theta}$  and enthalpy of hydration of ions,  $\Delta_{hyd}H^{\Theta}$  as  $\Delta_{sol}H^{\Theta} = \Delta_{lattice}H^{\Theta} + \Delta_{hyd}H^{\Theta}$ 

For most of the ionic compounds,  $\Delta_{sol} H^0$  is positive and the dissociation process is endothermic. Therefore the solubility of most salts in water increases with rise of temperature.

#### 7.6 ENTHALPY OF HYDRATION, $\Delta_{Hvd}H$ :

This is defined as the enthalpy change (evolved or absorbed) when one mole of the anhydrous salt combines with the required number of moles of water to form the specific hydrated salt.

 $CuSO_4(s) + 5H_2O(\ell) \longrightarrow CuSO_4.5H_2O(s)$ ;  $\Delta H_{Hydration} = -78.21 \text{ kJ mol}^{-1}$ Hydration is generally exothermic change.

If enthalpy of solution of the hydrated and anhydrous salt is known, then heat of hydration can be calculated.

#### For example :

(a)  $CuSO_4(s) + aq. \longrightarrow CuSO_4(aq.); \Delta_{sol}H = -66.50 \text{ kJ}$ (b)  $CuSO_4.5H_2O(s) + aq. \longrightarrow CuSO_4(aq.); \Delta_{sol}H = 11.71 \text{ kJ}$ Thus, (a - b) gives

$$CuSO_4(s) + 5H_2O(\ell) \longrightarrow CuSO_4.5H_2O(s)$$
;  $\Delta H_{Hydration} = -78.21 \text{ kJ}$ 

# JEE-Chemistry

**Ex.7.** Calculate the enthalpy change when infinitely dilute solutions of  $CaCl_2$  and  $Na_2CO_3$  mixed.  $\Delta H_{\rm f}^0$  for  $Ca^{2+}(aq.)$ ,  $CO_3^{2-}(aq.)$  and  $CaCO_3(s)$  are -129.80, -161.65, -288.5 kcal mole<sup>-1</sup> respectively.

Sol: On mixing  $CaCl_2(aq.)$  and  $Na_2CO_3$   $CaCl_2 + Na_2CO_3 \longrightarrow CaCO_3 \checkmark + 2NaCl$ Solutions are very dilute and thus 100% dissociation occurs.

$$Ca^{2+}(aq.) + 2Cl^{-}(aq.) + 2Na^{+}(aq.) + CO_{3}^{2-}(aq.) \longrightarrow CaCO_{3} \checkmark + 2Na^{+}(aq.) + 2Cl^{-}(aq.)$$
  
or  

$$Ca^{2+}(aq.) + CO_{3}^{2-}(aq.) \longrightarrow CaCO_{3}(s)$$
  

$$\therefore \qquad \Delta H = \sum H_{\text{products}}^{0} - \sum H_{\text{reactants}}^{0}$$
  
or  

$$\Delta H = H_{\text{f}CaCO_{3}}^{0} - \left[H_{\text{f}Ca^{2+}}^{0} + H_{\text{f}CO_{3}^{2-}}^{0}\right]$$
  

$$\therefore \qquad \Delta H^{\circ} \text{ of a compound} = \Delta H^{\circ} \text{ formation} = -288.5 - (-129.8 - 161.65) = 2.95 \text{ kcal}$$

#### 7.7 LATTICE ENTHALPY $(\Delta_{lattice} H)$ :

The lattice enthalpy of an ionic compound is the enthalpy change which occurs when one mole of an ionic compound dissociates into its ions in gaseous state under conditions of constant temperature and pressure.

Na<sup>+</sup>Cl<sup>-</sup>(s)  $\longrightarrow$  Na<sup>+</sup>(g) + Cl<sup>-</sup>(g) ;  $\Delta_{lattice} H = +788 \text{ kJ mol}^{-1}$ 

**7.7.1 Determination of lattic energy (Born-Haber cycle) :** Since, it is impossible to find the lattice enthalpies by direct experiment, it is generally calculated by indirect method known as **Born-Haber cycle**.

$$\begin{array}{c} M(s) + 1/2X_2(g) \longrightarrow MX(s) \\ \downarrow Step 1 \qquad & \downarrow Step 2 \\ M(g) \qquad & X(g) \\ \downarrow Step 3 \qquad & \downarrow Step 4 \\ M^+(g) \ + \ X^-(g) \longleftarrow \end{array}$$

#### **Born-Haber cycle**

The change in enthalpy that occurs when 1 mole of a solid crystalline substance is formed from its gaseous ions.

<b>Step 1</b> :	Conversion of metal to gaseous atoms.	
	$M(s) \longrightarrow M(g), \Delta H_1 = sublimation energy$	
<i>Step 2</i> :	Dissociation of $X_2$ molecules to X atoms	
	$X_2(g) \longrightarrow 2X(g), \Delta H_2 = Dissociation energy$	
<i>Step 3</i> :	Conversion of gaseous metal atom to metal ions by losing electron	
	$M(g) \longrightarrow M^+(g) + e^-, \Delta H_3 = Ionization enthalpy$	
<i>Step 4</i> :	$X(g)$ atoms gain an electron to form $M^-$ ions	
	$X(g) + e^- \longrightarrow X^-(g)$ , $\Delta H_4 =$ Electron gain enthalpy	

#### ALLEN

Step 5:  $M^+(g)$  and  $X^-(g)$  get together and form the crystal lattice  $M^+(g) + X^-(g) \longrightarrow MX(s)$ ,  $\Delta H_5 = Lattice$  enthalpy Applying Hess's law we get  $\Delta H_1 + \frac{1}{2}\Delta H_2 + \Delta H_3 + \Delta H_4 + \Delta H_5 = \Delta H_f(MX)$ 

On putting the various known values, we can calculate the lattice energy.

*Ex.8.* Calculate the proton affinity of  $NH_3(g)$  from the following data (in kJ/mole)

$\Delta H^0_{dissociation}$ : $H_2(g)$	= 218
$\Delta H^0_{\text{formation}}$ : NH <sub>3</sub> (g)	= -46
Lattice energy of NH <sub>4</sub> Cl	= -683
Ionisation energy of H	= 1310
Electron affinity of Cl	= 348
Bond dissociation energy $Cl_2(g)$	= 124
$\Delta H_{\text{formation}}^0$ : NH <sub>4</sub> Cl(s)	= -314

Sol: We have to calculate  $\Delta H$  for the following equation

$$\begin{split} NH_{3}(g) + H^{*}(g) &\longrightarrow NH_{4}^{*}(g) \\ Given : & H_{2}(g) \longrightarrow 2H(g) & : & \Delta H_{1} = 218 \ kJ/mole \\ & \frac{1}{2}N_{2}(g) + \frac{3}{2}H_{2}(g) \longrightarrow NH_{3}(g) & : & \Delta H_{2} = -46 \ kJ/mole \\ & NH_{4}Cl(s) \longrightarrow NH_{4}^{*}(g) + C\Gamma(g) & : & \Delta H_{3} = +683 \ kJ/mole \\ & H(g) \longrightarrow H^{+}(g) & : & \Delta H_{4} = 1310 \ kJ/mole \\ & Cl(g) \longrightarrow C\Gamma(g) & : & \Delta H_{5} = -348 \ kJ/mole \\ & Cl_{2}(g) \longrightarrow 2Cl(g) & : & \Delta H_{6} = 124 \ kJ/mole \\ & \frac{1}{2}N_{2}(g) + 2H_{2}(g) + \frac{1}{2}Cl_{2}(g) \rightarrow NH_{4}Cl(s) & : & \Delta H_{7} = -314 \ kJ/mole \\ & \Delta H = -\frac{1}{2}(\Delta H_{1}) - \Delta H_{2} + \Delta H_{3} - \Delta H_{4} - \Delta H_{5} - \frac{1}{2}(\Delta H_{6}) + \Delta H_{7} \\ & = -\frac{1}{2} \times 218 + 46 + 683 - 1310 + 348 - \frac{1}{2} \times 124 - 314 \\ & = -768 \ kJ/mole \end{split}$$

nack0& BOAIBO/Kata/EELAdvanced)/Enthusias/Chen/Sheet/Thermochemistry/Eng/01\_Theory.pd5

### 7.8 IONISATION ENTHALPY, $\Delta_i H$ :

Enthalpy change when one mole of gaseous atom is converted into gaseous ion by removing one mole electron from ground state is called ionisation enthalpy.

Example :

$$Na(g) \longrightarrow Na^{+}(g) + e; \Delta H_{Ionization}(Na(g))$$
$$H(g) \longrightarrow H^{+}(g) + e \quad ; \Delta H_{Ionization}(H(g))$$
$$\Delta_{i}H = I.E. + \frac{5}{2}RT$$

### 7.9 ELECTRON GAIN ENTHALPY, $\Delta_{eg}$ H :

Enthalpy change when 1 mole electrons are added to valence shell of gaseous atoms is called electron gain enthalpy.

Example :

$$Cl(g) + e \longrightarrow Cl^{-}(g) ; \Delta_{eg}H$$
$$\Delta_{eg}H = -E_{a} - \frac{5}{2}RT$$

#### 7.10 ENTHALPY OF ATOMISATION, $\Delta_a H$ :

It is the enthalpy change (always positive) when one mole of a substance is completely dissociated into atoms in the gaseous state, under constant pressure and temperature condition.

For example

$$H_2(g) \longrightarrow 2H(g) ; \Delta_a H = 435.0 \text{ kJ mol}^{-1}$$

 $CH_4(g) \longrightarrow C(g) + 4H(g); \Delta_a H = 1665 \text{ kJ mol}^{-1}$ 

# 7.11 ENTHALPY OF TRANSITION (Enthalpy of allotropic form) , $\Delta_{trs}H$ :

It is the enthalpy change when one mole of one allotropic form changes to another under conditions of constant temperature and pressure. For example

C(graphite)  $\longrightarrow$  C(diamond)  $\Delta_{trs}H = 1.90 \text{ kJ mol}^{-1}$ 

#### **EXERCISE # VI**

#### 35. Oxidising power of chlorine in aqueous solution can be determined by the parameters indicated below:

$$\frac{1}{2}\operatorname{Cl}_{2}(g) \xrightarrow{\frac{1}{2}\Delta_{des}H^{\circ}} \operatorname{Cl}(g) \xrightarrow{\Delta_{eg}H^{\circ}} \operatorname{Cl}^{-}(g) \xrightarrow{\Delta_{hyd}H^{\circ}} \operatorname{Cl}^{-}(aq) \qquad [AIEEE-2008]$$

The energy involved in the conversion of  $\frac{1}{2}$  Cl<sub>2</sub>(g) to Cl<sup>-</sup>(aq)

(using the data  $\Delta_{diss} H^{\Theta}_{Cl_2} = 240 \text{ kJ mol}^{-1}$ ,  $\Delta_{eg} H^{\Theta}_{Cl} = -349 \text{ kJ mol}^{-1}$ ,  $\Delta_{hyd} H^{\Theta}_{Cl^-} = -381 \text{ kJ mol}^{-1}$ ) will be:-

(A)  $-610 \text{ kJ mol}^{-1}$ (B)  $-850 \text{ kJ mol}^{-1}$ (C)  $+120 \text{ kJ mol}^{-1}$ (D)  $+152 \text{ kJ mol}^{-1}$ 

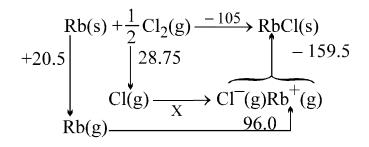

**36.** The lattice enthalpy of solid NaCl is 772 kJmol<sup>-1</sup> and enthalpy of solution is 2 kJmol<sup>-1</sup>. If the hydration enthalpy of Na<sup>+</sup> & Cl<sup>-</sup> ions are in the ratio of 3:2.5, what is the enthalpy of hydration of chloride ion?

 $(A) - 140 \text{ kJmol}^{-1} \qquad (B) - 350 \text{ kJmol}^{-1} \qquad (C) - 351.81 \text{ kJmol}^{-1} \qquad (D) - 420 \text{ kJ/mol}$ 

ALLEN

## ALLEN \_\_\_\_\_

- The rest of solution of anhydrous  $CuSO_4$  is 16 kcal and that of  $CuSO_4$ .5H<sub>2</sub>O is 3 kcal. Calculate 37. the enthalpy of hydration of  $CuSO_4$ .
- 38. Calculate the electron gain enthalpy of fluorine atom using the following data. (All the values are in kJ mol<sup>-1</sup> at 25° C).  $\Delta H_{diss}(F_2) = 160, \Delta_f H (NaF(s)) = -571, I.E. [Na(g)] = 494, \Delta H_{sub} [Na(s)]$ = 101, Lattice enthalpy of NaF(s) = 894.
- 39. The Born-Haber cycle for formation of rubidium chloride (RbCl) is given below (the enthalpies are in k Cal  $mol^{-1}$ )

Find the value of X.

40. By using the following data, calculate the enthalpy change of hydration of (i) the chloride ion ;(ii) the iodide ion.

> enthalpy change of solution of NaCl(s) = -2 kJ/mol. enthalpy change of solution of NaI(s) = +2 kJ/mol. enthalpy change of hydration of  $Na^+(g) = -390 \text{ kJ/mol.}$ lattice enthalpy of NaCl = -772 kJ/mol. lattice enthalpy of NaI = -699 kJ/mol.

## 7.12 ENTHALPY CHANGES DURING PHASE TRANSFORMATIONS :

Enthalpy of Fusion,  $\Delta_{fus}$ , H : It is the enthalpy change that accompanies melting of one mole of a **(i)** solid substance at constant temperature (melting point of solid) and pressure.

For example,

 $H_2O(s) \longrightarrow H_2O(l)$ ;  $\Delta_{fus}H = +6.00 \text{ kJ mol}^{-1}$ 

#### (ii) Enthalpy of Vaporisation, $\Delta_{vap}$ H :

It is the enthalpy change to vapourise one mole of a liquid substance at constant temperature (boiling point of liquid) and pressure for example :

$$H_2O(l) \longrightarrow H_2O(g)$$
;  $\Delta_{vap}H = +40.79 \text{ kJ mol}^{-1}$ 

#### **Enthalpy of Sublimation**, $\Delta_{sub}$ **H**: (iii)

It is the amount of enthalpy change to sublime one mole of a solid substance at constant temperature (sublimation temperature of solid) and pressure. For example

 $CO_2(s) \longrightarrow CO_2(g)$ ;  $\Delta_{sub}H = +25.2 \text{ kJ mol}^{-1}$ 

## LAWS OF THERMOCHEMISTRY

Lavoisier and Laplace law : Heat absorbed or evolved in a process is equal to the heat evolved (i) or absorbed when the process is reversed.

 $H_2(g) \longrightarrow 2H(g) \Delta H = +104 \text{ kcal}, 2H(g) \longrightarrow H_2(g) \Delta H = -104 \text{ kcal}$ 

It follows from this law that thermochemical equation may be reversed.

8.

## (ii) Hess's law of constant heat summation :

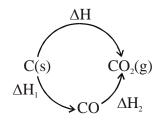

Heat change of a process is the same whether the process takes place in one step or several steps. It follows from this law that the thermochemical equation may be treated like alzebric equations. Hess's law is helpful in calculating those heat changes which cannot be determined experimentally. It has been experimentally verified and is also a consequence of the law of conservation of energy.

For example : Carbon can be converted into  $CO_2$  is 1 step

$$C(s) + O_2(g) \longrightarrow CO_2(g), \Delta H = -94$$
 kcal

Or in two steps

$$C(s) + \frac{1}{2}O_2(g) \longrightarrow CO(g), \Delta H_1 = -26.4 \text{ kcal}$$

LLEN

 $\operatorname{CO}(g) + \frac{1}{2}\operatorname{O}_2(g) \longrightarrow \operatorname{CO}_2(g), \Delta H_2 = -67.6 \text{ kcal}$ 

According to Hess's law :  $\Delta H = \Delta H_1 + \Delta H_2 = -26.4 - 67.6 = -94$  kcal.

- *Ex.9.* Calculate the heat of reaction for the hydrogenation of acetylene to ethylene at constant volume at 25°C from the following data.
  - (i) Enthalpy of formation of water =  $-285.8 \text{ kJ mol}^{-1}$
  - (ii) Enthalpy of combustion of acetylene = -1299.6 kJ mol<sup>-1</sup>
  - (iii) Enthalpy of combustion of ethylene =  $-1410.8 \text{ kJ mol}^{-1}$

Sol.: (i) 
$$H_2(g) + \frac{1}{2}O_2(g) \longrightarrow H_2O(\ell), \ \Delta H = -285.8 \ kJ \ mol^{-1}$$

(ii) 
$$C_2H_2(g) + \frac{5}{2}O_2(g) \longrightarrow 2CO_2(g) + H_2O(\ell), \ \Delta H = -1299.6 \ kJ \ mol^{-1}$$

(iii) 
$$C_2H_4(g) + 3O_2(g) \longrightarrow 2CO_2(g) + 2H_2O(\ell), \Delta H = -1410.8 \text{ kJ mol}^{-1}$$

Equation (ii) + equation (i) - equation (iii), we get  $C_2H_2(g) + H_2(g) \longrightarrow C_2H_4(g)$   $\Delta H = -1299.6 - 285.8 + 1410.8 = -174.6 \text{ kJ mol}^{-1}$  $\Delta E = -174.6 - (-1)(8.314 \times 10^{-3})(298) = -172.12 \text{ kJ mol}^{-1}$  **Ex.10.** Calculate  $\Delta H^{\circ}$  for the reaction

ALLEN\_

$$FeO(s) + 2H^{*}(aq) \longrightarrow H_{2}O(\ell) + Fe^{2*}(aq.)$$
Given that  $2Fe(s) + \frac{3}{2}O_{2}(g) \longrightarrow Fe_{2}O_{3}(s)$ ,  $\Delta H^{\circ} = -822.2 \text{ kJ mol}^{-1}$   
 $2FeO(s) + \frac{1}{2}O_{2}(g) \longrightarrow Fe_{2}O_{3}(s)$ ,  $\Delta H^{\circ} = -284.2 \text{ kJ mol}^{-1}$   
 $H_{2}(g) + \frac{1}{2}O_{2}(g) \longrightarrow H_{2}O(\ell)$ ,  $\Delta H^{\circ} = -284.0 \text{ kJ mol}^{-1}$   
 $Fe(s) + 2H^{+}(aq.) \longrightarrow Fe^{2+}(aq.) + H_{2}(g)$ ,  $\Delta H^{\circ} = -284.1 \text{ kJ mol}^{-1}$   
Sol. Eq.(iii) + Eq.(iv)  $-\frac{1}{2} \times \text{Eq.}(i) + \frac{1}{2} \times \text{Eq.}(ii)$ .  
 $\Delta H^{\circ}_{required} = (-286.0) + (-284.1) - \frac{1}{2} (-822.2) + \frac{1}{2}(-284.2) = -301.1 \text{ kJ/mol}.$   
*Ex.11. From the following data, determine*  $\Delta H_{1}^{0}(B_{2}H_{6})$  *at* 298 *K*;  
(a)  $B_{2}H_{0}(g) + 3O_{2}(g) \longrightarrow B_{2}O_{3}(s) + 3H_{2}O(g)$ ,  $\Delta H = -1941 \text{ kJ mol}^{-1}$   
(b)  $2B(s) + \frac{3}{2}O_{2}(g) \longrightarrow B_{2}O_{3}(s)$ ,  $\Delta H = -2368 \text{ kJ mol}^{-1}$   
(c)  $H_{2}(g) + \frac{1}{2}O_{2}(g) \longrightarrow H_{2}O(g)$ ,  $\Delta H = -36$   
 $2B(s) + \frac{3}{2}O_{2} \longrightarrow B_{2}O_{3}(s) ; \Delta H = -1273$   
 $3H_{2}O(t) \longrightarrow 3H_{2}O(g) ; \Delta H = 3 \times 44$   
 $3H_{2} + \frac{3}{2}O_{2}(g) \longrightarrow B_{2}O_{3}(s) + 3H_{2}O(g) ; \Delta H = -2035 \text{ kJ/mol}.$ 

For eq.(a),

$$(-1941) = [(-2368) + 3 (-241.8)] - [\Delta_{f} H^{0}_{B_{2}H_{6}(g)} + 3 \times 0]$$

$$\therefore [\Delta_{f} H^{0}_{B_{9}H_{6}(g)} = -1152.4 \text{ kJ/mol.}]$$

## **MISCELLANEOUS PREVIOUS YEARS QUESTION**

- Q.1 Which of the following is not an endothermic reaction?
  - (A) Combustion of methane
  - (B) Decomposition of water
  - (C) Dehydrogenation of ethene to acetylene
  - (D) Conversion of graphite to diamond

Ans. (A)

- Sol. Combustion reaction is always an exothermic reaction
- Q.2 Estimate the average S–F bond enthalpy in SF<sub>6</sub>. The  $\Delta H_{f}^{\circ}$  values of SF<sub>6</sub> (g), S(g), and F (g) are 1100, 275 and 80 kJ/mol respectively. [JEE 99, 5]

#### Ans. 309.16 kJ/mol

**Sol.**  $SF_6(g) \rightarrow S(g) + 6F(g)$ 

 $\Delta H_{rxn}^{0} = \Delta H_{f}^{0}[5(g)] + 6\Delta H_{F}^{0}[F(g)] - \Delta H_{F}[SF_{6}(g)]$ 

$$\Delta H_{rxn}^0 = 275 + (6 \times 80) + 1100$$

$$\Delta H_{rxn}^0 = 1855$$

$$(S-F) = \frac{\Delta H_{rxn}^0}{6} = \frac{1855}{6} = 309.166 \text{ kJ/mol.}$$

Q.3 Diborane is a potential rocket fuel which undergoes combustion according to the reaction,

$$B_2H_6(g) + 3O_2(g) \longrightarrow B_2O_3(s) + 3H_2O(g)$$

From the following data, calculate the enthalpy change for the combustion of diborane :[JEE 2000]

$2\mathbf{B}(\mathbf{s}) + \frac{3}{2}\mathbf{O}_2(\mathbf{g}) \longrightarrow \mathbf{B}_2\mathbf{O}_3(\mathbf{s});$	$\Delta H = -1273 \text{ kJ}$
$\mathrm{H}_{2}(\mathrm{g}) + \frac{1}{2}\mathrm{O}_{2}(\mathrm{g}) \longrightarrow \mathrm{H}_{2}\mathrm{O}(l);$	$\Delta H = -286 \text{ kJ}$
$H_2O(l) \longrightarrow H_2O(g);$	$\Delta H = 44 \text{ kJ}$
$2B(s) + 3H_2(g) \longrightarrow B_2H_6(g);$	$\Delta H = 36 \text{ kJ}$

Ans. –2035kJ mol<sup>-1</sup>

Sol. 
$$B_2H_6(g) \longrightarrow 2B(s) + 3H_2(g); \Delta H = -36 \text{ kJ}$$
  
 $2B(s) + \frac{3}{2}O_2(g) \longrightarrow B_2O_3(s); \Delta H = -1273 \text{ kJ}$   
 $3H_2(g) + \frac{3}{2}O_2(g) \longrightarrow 3H_2(l); \Delta H - 8.58 \text{ kJ}$   
 $3H_2O(l) \longrightarrow 3H_2O_2(g); \Delta H 132 \text{ kJ}$   
 $B_2H_6(g) + 3O_2(g) \longrightarrow B_2O_3(s) + 3H_2O(g); \Delta H = -2035$

Q.4  $\Delta H_{f}^{\circ}$  for CO<sub>2</sub>(g), CO(g) and H<sub>2</sub>O(g) are - 393.5, -110.5 and -241.8 kJ mol<sup>-1</sup> respectively. The standard enthalpy change (in kJ) for the reaction  $CO_2(g) + H_2(g) \longrightarrow CO(g) + H_2O(g)$  is (B) 41.2 (A) 524.1 (C) -262.5 (D) – 41.2 **[JEE 2000]** Ans. (B)

Sol. 
$$CO_2(g) + H_2(g) \longrightarrow CO(g) + H_2O(g)$$
  
 $\Delta H_{rxn}^0 = (\Delta H_f^0[CO(g)] + \Delta H_f^0[H_2O(g)]) - (\Delta H_f^0[CO_2(g)] + \Delta H_f^0[H_2O(g)])$   
 $\Delta H_{rxn}^0 = (-110.5 - 241.8) - (-393.5 + 0)$ 

= +41.2 kJ/mol

Q.5 Which of the following reactions defines  $\Delta H_{f}^{\circ}$ ?

$$(A) C_{(diamond)} + O_2(g) \longrightarrow CO_2(g) \qquad (B) 1/2 H_2(g) + 1/2 F_2(g) \longrightarrow HF(g)$$
$$(C) N_2(g) + 3H_2(g) \longrightarrow 2NH_3 \qquad (D) CO(g) + 1/2O_2(g) \longrightarrow CO_2(g)$$
[JEE 2003]

Ans. (B)

- Sol. In the formation reaction, 1 mole proudcts should be formed from its elements and elements must be in their most abundance state this condition is fulfilled by options (B)
- Q.6 In a constant volume calorimeter, 3.5 g of a gas with molecular weight 28 was burnt in excess oxygen at 298.0 K. The temperature of the calorimeter was found to increase from 298.0 K to 298.45 K due to the combustion process. Given that the heat capacity of the calorimeter is 2.5 kJ K<sup>-1</sup>, the numerical value for the enthalpy of combustion of the gas in kJ mol<sup>-1</sup> is [JEE 2009]

Ans. (9)

**Sol.** 
$$q = (2.5) (0.45) = 1.125$$

$$\Delta U_{\text{combination}} = (1.125) \left(\frac{28}{3.5}\right) = -9 \text{kJ/mol}$$

# EXERCISE # (S-I)

#### Relationship between $\Delta H \& \Delta U$

- Q.1 The enthalpy change for the reaction of 50 ml of ethylene with 50.0 ml of H<sub>2</sub> at 1.5 bar pressure is  $\Delta H = -0.31$  KJ. What is the  $\Delta U$  ?
- Q.2 Ethyl chloride ( $C_2H_5Cl$ ), is prepared by reaction of ethylene with hydrogen chloride:  $C_2H_4(g) + HCl(g) \rightarrow C_2H_5Cl(g)$   $\Delta H = -72.3 \text{ kJ}$ What is the value of  $\Delta E$  (in kJ), if 98 g of ethylene and 109.5 g of HCl are allowed to react at 300 K.
- Q.3 Determine the amount of heat (in kcal) given off at constant volume when 0.5 mol of  $N_2$  & 1.5 mol of  $H_2$  reacted according to equation at 300 K.

 $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g) ; \Delta_r H_{300} = -380 \text{ kcal/mol}$ (Given : R = 2 cal / mol-K)

Q.4 Ethyl chloride ( $C_2H_5Cl$ ), is prepared by reaction of ethylene with hydrogen chloride :

$$C_2H_4(g) + HCl(g) \longrightarrow C_2H_5Cl(g)$$
  $\Delta H = -72.3 \text{ kJ/mol}$ 

What is the value of  $\Delta U$  (in kJ), if 70 g of ethylene and 73 g of HCl are allowed to react at 300 K.

Q.5 Determine  $\Delta H$  for the following reaction at 500K and constant pressure :

 $CO(g) + H_2O(g) \rightarrow CO_2(g) + H_2(g)$ 

use the following data :

Substance	C <sub>p</sub> (J/mol K)	$\Delta_f H(300K) (kJ/mol)$
CO (g)	29	-110
$H_2O(g)$	33	-241
$CO_2(g)$	37	-393
$H_2(g)$	29	0

#### Enthalpy of formation and combustion

- Q.6 When 2 moles of  $C_2H_6(g)$  are completely burnt, 3120 kJ of heat is liberated. Calculate the enthalpy of formation, of  $C_2H_6(g)$ . Given  $\Delta_f H$  for  $CO_2(g)$  &  $H_2O(l)$  are 395 & 286 kJ respectively.
- Q.7 From the following data at 25°C, Calculate the standard enthalpy of formation of FeO(s) and of  $Fe_2O_3(s)$ .

Reaction	$\Delta_{\rm r} {\rm H}^{\rm o}$ (kJ/mole)
(1) $\operatorname{Fe}_2O_3(s) + 3C(\operatorname{graphite}) \rightarrow 2\operatorname{Fe}(s) + 3\operatorname{CO}(g)$	492
(2) FeO (s) + C(graphite) $\rightarrow$ Fe(s) + CO(g)	155
(3) C(graphite) + $O_2(g) \rightarrow CO_2(g)$	-393
(4) $\operatorname{CO}(g) + 1/2 \operatorname{O}_2(g) \rightarrow \operatorname{CO}_2(g)$	-282
At 300 K the standard enthalpies of formation	of C H COOH(c) CC

Q.8 At 300 K, the standard enthalpies of formation of  $C_6H_5COOH(s)$ ,  $CO_2(g)$  &  $H_2O(l)$  are -408, -393 & -286 kJ mol<sup>-1</sup> respectively. Calculate the heat of combustion of benzoic acid at : (i) constant pressure (ii) constant volume.

## JEE-Chemistry

- Q.9 A cylinder of gas is assumed to contains 11.6 kg of butane. If a normal family needs 26,500 kJ of energy per day for cooking, how long will the cylinder last if the enthalpy of combustion,  $\Delta H = -2650 \text{ kJ/mole}$  for butane.
- Q.10 0.821 *l* sample of a mixture of  $CH_4(g) \& O_2(g)$  measured at 27° C & 760 torr was allowed to react at constant pressure in a calorimeter which together with its contents had a heat capacity of 1200 Cal/K. The complete combustion of methane to  $CO_2 \& H_2O$  caused a temperature rise, in the calorimeter, of 0.25 K. What was the mole percent of  $CH_4$  in the original mixture?

 $\Delta H^{o}_{\text{comb}} (CH_4) = -200 \text{ kcal mol}^{-1}.$ 

#### Bond Enthalpy

Q.11 Compute the enthalpy of formation of liquid methyl alcohol in kJ mol<sup>-1</sup>, using the following data. Enthalpy of vaporisation of liquid  $CH_3OH = 38 \text{ kJ/ mol}$ .

Enthalpy of formation of gaseous atoms from the elements in their standard states are

 $\mathrm{H} \mathop{\rightarrow} 218 \; \mathrm{kJ/mol} \;\; ; \;\; \mathrm{C} \mathop{\rightarrow} 715 \; \mathrm{kJ/mol} \; ; \;\; \mathrm{O} \mathop{\rightarrow} 249 \; \mathrm{kJ/mol}.$ 

Bond Enthalpies

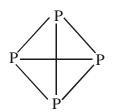

$$C - H \rightarrow 415 \text{ kJ/mol}$$
;  $C - O \rightarrow 356 \text{ kJ/mol}$ ;  $O - H \rightarrow 463 \text{ kJ/mol}$ 

Q.12 Find the enthalpy of S–S bond from the following data.

- (i)  $C_2H_5 S C_2H_5(g)$   $\Delta_f H^\circ = -150 \text{ kJ/mol}$ (ii)  $C_2H_5 - S - S - C_2H_5(g)$   $\Delta_f H^\circ = -200 \text{ kJ/mol}$ (iii) S(g)  $\Delta_f H^\circ = 225 \text{ kJ/mol}$
- Q.13 The polymerisation of ethylene to linear polyethylene is represented by the reaction  $n CH_2 = CH_2(g) \rightarrow (-CH_2 - CH_2)_n(g)$

where n has a large integral value. Given that the average enthalpies of bond dissociation for C=C & C-C at 298 K are +590 & +331 kJ mol<sup>-1</sup> respectively. Calculate the enthalpy of polymerisation per mole of ethylene at 298 K.

Q.14 White phosphorus is a tetra-atomic solid  $P_4(s)$  at room temperature.

Find average (P – P) bond enthalpy in kJ/mol. Given :  $\Delta H_{sublimation}$  of P<sub>4</sub> (s) = 59 kJ/mol

 $\Delta H_{\text{atomisation}} \text{ of P}_4 (s) = 1265 \text{ kJ/mol}$ 

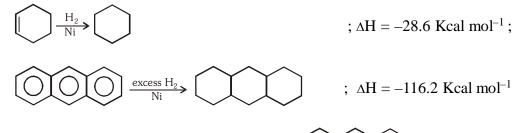

## ALLEN.

Q.15 Calculate enthalpy of combustion of propane  $[C_3H_8(g)]$  in **kJ/mol** at 298 K.

Given : B.E. (O = O) = 498 kJ/mole;B.E. (C = O) = 804 kJ/moleB.E. (C-H) = 410 nkJ/mole;B.E. (O-H) = 464 kJ/moleB.E. (C-C) = 345 kJ/mole;Resonance energy of  $CO_2(g) = -143 \text{ kJ/mole}$ 

 $\Delta H_{\text{vaporization}} (\text{H}_2\text{O}, l) = 41 \text{ kJ/mole}$ 

Q.16 Use the following data to answer the questions below :

Calculate the resonance energy of anthracene,

Q.17 Calculate the magnitude of resonance enthalpy of  $CO_2(g)$  from following data

 $\Delta H^{\circ}_{combustion}[C_{(graphite)}] = -390 \text{ kJ/mol}$ 

 $\Delta H^{\circ}_{atomisation}[C_{(graphite)}] = 715 \text{ kJ/mol}$ 

 $\Delta H_{B,E}^{\circ}[O=O] = 500 \text{ kJ/mol}$ 

 $\Delta H_{B,E}^{\circ}[C=O] = 800 \text{ kJ/mol}$ 

## Other types of Enthalpy of reaction

Q.18  $H^+ + OH^- \longrightarrow H_2O$ ;  $\Delta H^\circ = -57 \text{ kJ/mol}$ 

 $\Delta H_{\text{ionisation}}^{0}[\text{HCN}] = 45 \text{ kJ/mol}$ 

If 200 ml , 1/10 M Ba(OH)<sub>2</sub> solution is mixed with 500 ml , 1/10 M HCN, then evolved heat will be.

- Q.19 The enthalpies of neutralization of NaOH &  $NH_4OH$  by HCl are 13680 Cal/Eq and 12270 Cal/Eq. respectively. What would be the enthalpy change if one gram equivalent of NaOH is added to one gram equivalent of  $NH_4Cl$  in solution ? Assume that  $NH_4OH$  and NaCl are quantitatively obtained.
- Q.20 Two solutions initially at 25°C were mixed in an adiabatic constant pressure calorimeter. One contains 400 ml of 0.2 M weak monoprotic acid solution. The other contain 100 ml of 0.80 M NaOH. After mixing temperature increased to 26.2 °C. How much heat is evolved in the neutralization of 1 mole of acid? Assume density of solution 1.0 g/cm<sup>3</sup>, and specific heat of solution 4.2 J/g-K. Neglect heat capacity of the calorimeter.
- $Q.21 \quad If the enthalpy of formation of HCl(g) and Cl<sup>-</sup>(aq) are -90 kJ/mole and -170 kJ/mol, find the enthalpy of solution of hydrogen chloride gas.$

Q.22 From the following data of  $\Delta H$  of the following reactions

 $C(s) + 1/2O_2(g) \longrightarrow CO(g); \Delta H = -110 \text{ kJ}$ 

and 
$$C(s) + H_2O(g) \longrightarrow CO(g) + H_2(g)$$
;  $\Delta H = 130 \text{ kJ}$ 

Calculate the mole ratio of steam and oxygen on being passed over coke at 1273 K, keeping the reaction temperature constant.

#### Miscellaneous

- Q.23 Lime is made commercially by decomposition of limestone,  $CaCO_3$ . What is the change in internal energy when 1.00 mole of solid  $CaCO_3(V = 34 \text{ ml})$  absorbs 180 kJ of heat and decomposes at certain temperature against a pressure of 1.0 bar to give solid CaO.(Volume = 16 ml) and  $CO_2(g)(V = 20 \text{ L})$ .
- Q.24. One mole of solid Zn is placed in excess of dilute  $H_2SO_4$  at 27°C in a cylinder fitted with a piston. Find the value of  $\Delta U$ , q and w for the process if the area of piston is 500 cm<sup>2</sup> and it moves out by 50 cm against a pressure of 1 atm during the reaction. The heat given to surrounding is 36.5 kJ.

 $Zn(s) + 2H^{+}(aq) \rightleftharpoons Zn^{2+}(aq) + H_{2}(g)$ 

Q.25 For the reaction:

 $3A(g) + 2B(g) \longrightarrow 4C(g)$ 

at 300K if 5 moles of A are mixed with 4 moles of B, work in the process will be.

# EXERCISE # (S-II)

- Q.1 The enthalpy of formation of  $C_2H_5OH(l)$  is -66 k Cal/mol. The enthalpy of combustion of  $CH_3-O-CH_3$  is -348 k Cal/mol. Given that the enthalpies of formation of  $CO_2(g)$  and  $H_2O(l)$  are -94 k Cal/mol & -68 kcal/mol respectively, calculate  $\Delta H$  for the isomerisation of ethanol to methoxymethane. All data are at 25°C.
- Q.2 Calculate the mass of mercury which can be liberated from HgO at 27° C by the treatment of excess HgO with 9 kJ of heat at (a) constant pressure, (b) constant volume Given :  $\Delta H_f^{\circ}$  (HgO, s) = -90 kJ mol<sup>-1</sup> & Molar mass of (Hg) = 200 g mol<sup>-1</sup>.
- Q.3 A stoichiometric mixture of ferric oxide & Al is used as solid rocket fuel. Calculate the fuel value per gm & fuel value per CC of the mix. Enthalpy of formation & densities are :  $\Delta H_f^o (Al_2O_3) = -399 \text{ k Cal/mole}; \quad \Delta H_f^o (Fe_2O_3) = -199 \text{ kcal/mole},$ density of  $Fe_2O_3 = 5.2 \text{ g/cc}$ ; density of Al = 2.7 g/cc.
- Q.4 Calculate the enthalpy change for the reaction :  $XeF_4 \longrightarrow Xe^+ + F^- + F_2 + F$ . The average Xe–F bond enthalpy is 34 kcal/mol, first I.E. of Xe is 279 kcal/mol, electron affinity of F is 85 kcal/mol & bond dissociation enthalpy of  $F_2$  is 38 kcal/mol.
- Q.5 Calculate the bond enthalpy of the O–H bond in water at 298K using the data/information given below :-
  - (A)  $\Delta_{f} H^{0}[H(g)] = 218 \text{ kJ/mol}$
  - (B)  $\Delta_{f} H^{0}[O(g)] = 249.2 \text{ kJ/mol}$
  - (C)  $\Delta_{f} H^{0}[H_{2}O(g)] = -241.8 \text{ kJ/mol}$

The bond enthalpy of the O–H bond in water is defined as one-half of the enthalpy change for the reaction  $H_2O(g) \rightarrow 2H(g) + O(g)$ .

Also, determine the  $\Delta U$  of the O–H bond in water at 298K. Assume ideal gas behaviour.

**Given :**  $(8.314 \times 0.298 = 2.5)$ 

Q.6 (i) From the following data :

Enthalpy of formation of  $C_2H_6 = -83$  kJ/mol

Enthalpy of sublimation of graphite = 719 kJ/mol

Enthalpy of bond dissociation of  $H_2 = 435 \text{ kJ/mol}$ 

C-H bond enthalpy = 414 kJ/mol

Calculate the bond enthalpy of C - C

(ii) By using data of above question calculate bond enthalpy of C=N if enthalpy of formation of  $CH_3CN = 87 \text{ kJ/mol}$  and enthalpy of bond dissociation of nitrogen = 945 kJ/mol

Q.7 Calculate the enthalpy change when infinitely dilute solution of  $CaCl_2$  and  $Na_2CO_3$  are mixed  $\Delta_f H^\circ$  for  $Ca^{2+}(aq)$ ,  $CO_3^{2-}(aq)$  and  $CaCO_3$  (s) are -129, -161, -288 kcal mol<sup>-1</sup> respectively.

Q.9 The bond dissociation energy of gaseous  $H_2$ ,  $Cl_2$  and HCl are 104, 58 and 103 kcal mol<sup>-1</sup> respectively. The enthalpy of formation for HCl gas will be :-

(A) -44.0 kcal/mol (B) -22.0 kcal/mol (C) 22.0 kcal/mol (D) 44.0 kcal/mol Q.10 The reaction  $CH_4(g) + Cl_2(g) \longrightarrow CH_3Cl(g) + HCl(g)$  has  $\Delta H = -25$  kcal.

Bond	Bond Enthalpy kCal
ε <sub>c—cl</sub>	84
$\epsilon_{H-Cl}$	103
$\mathcal{E}_{C-H}$	Х
ε <sub>cl−Cl</sub>	У
x :	y = 9 : 5

From the given data, what is the bond enthalpy of Cl—Cl bond

(A) 70 kcal/mol (B) 80 kcal/mol (C) 67.75 kcal/mol (D) 57.86 kcal/mol

Q.11 If  $x_1$ ,  $x_2$  and  $x_3$  are enthalpies of H–H, O=O and O–H bonds respectively, and  $x_4$  is the enthalpy of vaporisation of water, estimate the standard enthalpy of combustion of hydrogen

(A) 
$$x_1 + \frac{x_2}{2} - 2x_3 + x_4$$
 (B)  $x_1 + \frac{x_2}{2} - 2x_3 - x_4$  (C)  $x_1 + \frac{x_2}{2} - x_3 + x_4$  (D)  $2x_3 - x_1 - \frac{x_2}{2} - x_4$ 

Q.12If bond enthalpy of C–C and C = C are 348 kJ /mole and 615 kJ/mole respectively then calculate enthalpy<br/>change (in kJ/mole) which occurs during the isomerisation of cyclopropane (g) into propene(g)<br/>(A) -267 (B) 81 (C) -81 (D) 267

Q.13 If enthalpy change for hydrogenation of ethylene is -132 kJ/mole and enthalpy of formation 1,3-butadiene
 (g) and butane (g) are 115 kJ and -140 kJ/mole respectively then calculate resonance energy of 1,3-budadiene (in kJ).

Q.14 Given the correct order of initials T (true) or F (false) for following statements.
(i) For the reaction CaCO<sub>3</sub> (Calcite) → CaCO<sub>3</sub> (aragonite) ; ΔH= – 1127.75 kJ/mol, then Calcite form is more stable at standard conditions.

- (ii) For the reaction,
- (a) C(diamond) + 2H<sub>2</sub>(g)  $\rightarrow$  CH<sub>4</sub>(g) ;  $\Delta$ H<sub>1</sub>
- (b)  $C(g) + 4H(g) \rightarrow CH_4(g)$ ;  $\Delta H_2$

then more heat is evolved in reaction (b)

- (iii)  $\Delta_{f} H^{\circ} (I_{2},g) = \Delta_{sub} H [I_{2}, s]$  at 25°C
- (iv) For the exothermic reaction  $2Ag(s) + 1/2 O_2(g) \rightarrow 2Ag_2O(s)$  at 298 K.  $\Delta H < \Delta U$
- (A) FTTT (B) TTFT (C) TFTF (D) TTTT

#### ALLEN \_\_\_\_\_

Q.17

Q.15  $\Delta_r$ H of which of the following reactions is zero?

 $\begin{array}{ll} (A) \ H_2(g) \to 2H^+ \ (g) + 2e^- \\ (C) \ 2H(g) \to 2H^+ \ (g) + 2e^- \\ \end{array} \\ \begin{array}{ll} (B) \ 2H \ (g) + aq \to 2H^+ (aq) + 2e^- \\ (D) \ H_2(g) + aq \to 2H^+ (aq) + 2e^- \\ \end{array}$ 

 $Q.16 \quad \Delta H^0_f \ \text{of water is} - 285.8 \ \text{kJ mol}^{-1}. \ \text{If enthalpy of neutralisation of monoacid strong base and mono basic}$ 

strong acid is –57.3 kJ mol $^{-1},\,\Delta H^0_{\rm f}\,$  of OH $^-$  ion will be

 $(A) - 228.5 \text{ kJ mol}^{-1}$  $(B) 228.5 \text{ kJ mol}^{-1}$  $(C) 114.25 \text{ kJ mol}^{-1}$  $(D) -114.25 \text{ kJ mol}^{-1}$ Ethanol can undergoes decomposition to form two sets of products

$$C_{2}H_{5}OH(g) \longrightarrow \begin{array}{c} 1 \\ C_{2}H_{4}(g) + H_{2}O(g) ; \quad \Delta H^{\circ} = 45 \text{ kJ} \\ 2 \\ CH_{3}CHO(g) + H_{2}(g) ; \quad \Delta H^{\circ} = 63 \text{ kJ} \end{array}$$

if the molar ratio of  $C_2H_4$  to  $CH_3CHO$  is 8 : 1 in a set of product gases, then the enthalpy involved in the decomposition of 1 mole of ethanol is

(A) 
$$423 \text{ kJ}$$
 (B)  $47 \text{ kJ}$  (C)  $61 \text{ kJ}$  (D)  $549 \text{ kJ}$ 

Q.18 The enthalpy changes of the following reactions at 27°C are

$$\begin{split} \text{Na(s)} &+ \frac{1}{2} \operatorname{Cl}_2(g) \longrightarrow \operatorname{NaCl}(s) & \Delta_r H = -411 \text{ kJ/mol} \\ \text{H}_2(g) + \text{S}(s) + 2\text{O}_2(g) \longrightarrow \text{H}_2 \text{SO}_4(l) & \Delta_r H = -811 \text{ kJ/mol} \\ 2\text{Na(s)} + \text{S}(s) + 2\text{O}_2(g) \longrightarrow \text{Na}_2 \text{SO}_4(s) & \Delta_r H = -1382 \text{ kJ/mol} \\ \frac{1}{2} \text{H}_2(g) + \frac{1}{2} \operatorname{Cl}_2(g) \longrightarrow \text{HCl}(g) & \Delta_r H = -92 \text{ kJ/mol}; \end{split}$$
from these data, the heat change of reaction at constant volume ( in k I/mol) at 27°C for the process

from these data, the heat change of reaction at constant volume ( in kJ/mol) at 27°C for the process  $2NaCl (s) + H_2SO_4 (l) \longrightarrow Na_2SO_4 (s) + 2HCl (g) \text{ is } (R = 8.3 \text{ J/K-mol})$ (A) 67 (B) 62.02 (C) 71.98 (D) 64.51

Q.19Reactions involving gold have been of particular interest to a chemist . Consider the following reactions,<br/>  $Au(OH)_3 + 4 HCl \longrightarrow HAuCl_4 + 3 H_2O$ ,  $\Delta H = -28 kcal$ <br/>  $Au(OH)_3 + 4 HBr \longrightarrow HAuBr_4 + 3 H_2O$ ,  $\Delta H = -36.8 kcal$ <br/>
In an experiment there was an absorption of 0.44 kcal when one mole of HAuBr\_4 was mixed with<br/>
4 moles of HCl. What is the percentage conversion of HAuBr\_4 into HAuCl\_4 ?<br/>
(A) 0.5 % (B) 0.6 % (C) 5 % (D) 50 %

#### Passage (Q. 12 to Q.13)

Bond dissociation enthalpy of the first H-S bond in hydrogen sulphide is 376 kJ/mole. The enthalpies of formation of H<sub>2</sub>S(g) and S(g) are -20.0 and 277.0 kJ/mole respectively. The enthalpy of formation of gaseous hydrogen atom is 218 kJ/mole. Using above information, answer following questions :

Q.12 The enthalpy of formation of free radical HS is

(A) 138 kJ/mole	(B) –138 kJ/mole	(C) - 10  kJ/mole	(D) 357 kJ/mole
13 The bond dissociation	enthalpy of the free radica	l HS is	

(A) 138 kJ/mole	(B) 276 kJ/mole	(C) 357 kJ/mole	(D) 376 kJ/mole
-----------------	-----------------	-----------------	-----------------

#### Paragraph for Q.14 to Q.15

Amount of heat evolved during complete combustion of liquid benzene can be calculated from the following data.

(i) 18 gm of graphite on complete combustion evolve 591 kJ heat

(ii)  $\Delta H_{f}^{\circ}(H_2O, \ell) = -286 \text{ kJ/mol}$ 

(iii) The heat of formation of liquid benzene is 50 kJ/mole

Q.14 Heat of formation of CO<sub>2</sub>(g) from following data is-

(A) - 286 kJ/mole(B) - 590 kJ/mole(C) - 394 kJ/mole(D) -3268 kJ/mole

Q.15 Find heat evolved from combustion of 78 gm benzene

(A) 3272 kJ	(B) 6345 kJ	(C) 4536 kJ	(D) 5364 kJ

# JEE-Chemistry

	EXERCIS	E # J-MAIN	
1.	Consider the reaction :		[AIEEE-2011]
	$4NO_2(g) + O_2(g) \rightarrow 2N_2O_5(g), \Delta_rH = -1111$	kJ.	
	If $N_2O_5(s)$ is formed instead of $N_2O_5(g)$ in t	the above reaction, the	he $\Delta_r H$ value will be :-
	(given, $\Delta H$ of sublimation for $N_2O_5$ is 54 kJ	mol <sup>-1</sup> )	
	(1) $-165 \text{ kJ}$ (2) $+54 \text{ kJ}$	(3) +219 kJ	(4) –219 kJ
2.	The value of enthalpy change ( $\Delta H$ ) for the read	ction	
	$C_2H_5OH_{(\ell)} + 3O_{2(g)} \rightarrow 2CO_{2(g)} + 3H_2O_{(\ell)}$		
	at 27°C is –1366.5 kJ mol <sup>-1</sup> . The value of interna	al energy change for the	e above reaction at this temperature
	will be :-		[AIEEE-2011]
	(1) –1371.5 kJ (2) –1369.0 kJ	(3) –1364.0 kJ	(4) –1361.5 kJ
3.	The enthalpy of neutralisation of NH <sub>4</sub> OH with	HCl is –51.46 kJ mol-	<sup>1</sup> and the enthalpy of neutralisation
	of NaOH with HCl is -55.90 kJ mol <sup>-1</sup> . The er	nthalpy of ionisation o	of NH <sub>4</sub> OH is:
			[JEE-MAINS (online) 2012]
_	(1) +107.36 kJ mol <sup>-1</sup> (2) $-4.44$ kJ mol <sup>-1</sup>	(3) –107.36 kJmo	l <sup>-1</sup> (4) +4.44 kJ mol <sup>-1</sup>
4.	Given		[JEE-MAINS (online) 2013]
	<b>Reaction</b> $\text{Li}(s) \longrightarrow \text{Li}(g)$	Energy Change	(in kJ)
	$Li(g) \longrightarrow Li(g)$ $Li(g) \longrightarrow Li^{+}(g)$	520	
		520	
	$\frac{1}{2}F_2(g) \longrightarrow F(g)$	77	
	$F(g) + e^- \longrightarrow F^-(g)$	(Electron gain enth	alnv)
	$Li^+(g) + F^-(g) \longrightarrow LiF(s)$	–1047	
	1		
	$\operatorname{Li}(s) + \frac{1}{2}\operatorname{F}_{2}(g) \longrightarrow \operatorname{Li} \operatorname{F}(s)$	-617	
	Based on data provided, the value of electro	on gain enthalpy of fl	uorine would be :
	(1) $-300 \text{ kJ mol}^{-1}$ (2) $-328 \text{ kJ mol}^{-1}$		
5.	Given :		[JEE-MAINS (online) 2013]
	(1) $H_{2}(g) + \frac{1}{2}O_{2}(g) \rightarrow H_{2}O(l); \Delta H^{o}_{298K}$	$= -285.9 \text{ kJ mol}^{-1}$	
	(2) $H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(g); \Delta H^{o}_{_{298K}}$	$= -241.8 \text{ kJ mol}^{-1}$	
	The molar enthalpy of vapourisation of water		
	(1) 241. 8 kJ mol <sup>-1</sup> (2) 527.7 kJ mol <sup>-1</sup>		
6.	The standard enthalpy of formation $(\Delta_{f} H^{o}_{298})$ f the average energy given out in the formation o	tor methane, $CH_4$ is $-7$	$(4.9 \text{ kJ mol}^{-1})$ . In order to calculate
	of the following?		[JEE-MAINS(online) 2014]
	(1) the dissociation energy of the hydrogen mo	olecule, H <sub>2</sub> .	· / •
	(2) the dissociation one ray of U and antholny	of auhlimation of comb	on (anombita)

(2) the dissociation energy of  $H_2$  and enthalpy of sublimation of carbon (graphite).

- (3) the first four ionisation energies of carbon and electron affinity of hydrogen.
- (4) the first four ionisation energies of carbon.

For complete combustion of ethanol,  $C_2H_5OH(\ell) + 3O_2(g) \rightarrow 2CO_2(g) + 3H_2O(\ell)$ , the amount of heat 7. produced as measured in bomb calorimeter, is 1364.47 kJ mol<sup>-1</sup> at 25°C. Assuming ideality the Enthalpy of combustion,  $\Delta_c$ H, for the raction will be :-[JEE-MAINS(offline)2014]  $(R = 8.314 \text{ J mol}^{-1})$ (1)  $-1460.50 \text{ kJ mol}^{-1}$  (2)  $-1350.50 \text{ kJ mol}^{-1}$  (3)  $-1366.95 \text{ kJ mol}^{-1}$  (4)  $-1361.95 \text{ kJ mol}^{-1}$ 8. The heats of combustion of carbon and carbon monoxide are – 393.5 and – 285.5 kJ mol<sup>-1</sup>, respectively. The heat of formation (in kJ) of carbon monoxide per mole is :-[JEE-MAINS(offline)2016] (1) - 110.5(2) 110.5(3) 676.5(4) - 676.59. The enthalpy change on freezing of 1 mol of water at  $5^{\circ}$ C to ice at  $-5^{\circ}$ C is : (Given  $\Delta_{\text{fus}}$ H = 6 kJ mol<sup>-1</sup> at 0°C, C<sub>P</sub>(H<sub>2</sub>O, *l*) = 75.3 J mol<sup>-1</sup> K<sup>-1</sup>, C<sub>P</sub>(H<sub>2</sub>O, s) = 36.8 J mol<sup>-1</sup> K<sup>-1</sup>) [JEE-MAINS(online)2017] (1) 6.56 kJ mol<sup>-1</sup> (2) 5.81 kJ mol<sup>-1</sup> (3) 6.00 kJ mol<sup>-1</sup> (4) 5.44 kJ mol<sup>-1</sup> 10. Given [JEE-MAINS(offline)2017]  $C_{(grahite)} + O_2(g) \rightarrow CO_2(g)$ ;  $\Delta_r H^\circ = -393.5 \text{ kJ mol}^{-1}$  $H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(l); \quad \Delta_r H^\circ = -285.8 \text{ kJ mol}^{-1}$  $CO_2(g) + 2H_2O(l) \rightarrow CH_4(g) + 2O_2(g) ; \Delta_r H^\circ = +890.3 \text{ kJ mol}^{-1}$ Based on the above thermochemical equations, the value of  $\Delta_r H^\circ$  at 298 K for the reaction  $C_{(grabite)} + 2H_2(g) \rightarrow CH_4(g)$  will be :-(1) +74.8 kJ mol<sup>-1</sup> (2) +144.0 kJ mol<sup>-1</sup> (3) -74.8 kJ mol<sup>-1</sup> (4) -144.0 kJ mol<sup>-1</sup> The combustion of benzene (l) gives  $CO_2(g)$  and  $H_2O(l)$ . Given that heat of combustion 11. of benzene at constant volume is  $-3263.9 \text{ kJ mol}^{-1}$  at  $25^{\circ} \text{ C}$ ; heat of combustion (in kJ mol<sup>-1</sup>) of benzene at constant pressure will be -[JEE-MAINS(offline)2018]  $(R = 8.314 \text{ JK}^{-1} \text{ mol}^{-1})$ (1) - 452.46(2) 3260(3) - 3267.6(4) 4152.612. Given [JEE-MAINS(online)2018] (i)  $2\text{Fe}_2\text{O}_3(s) \rightarrow 4\text{Fe}(s) + 3\text{O}_2(g)$ ;  $\Delta_r\text{G}^\circ = +1487.0 \text{ kJ mol}^{-1}$  $\Delta_r G^\circ = -514.4 \text{ kJ mol}^{-1}$ (ii)  $2CO(g) + O_2(g) \rightarrow 2CO_2(g)$ ; Free energy change,  $\Delta_r G^\circ$  for the reaction  $2\text{Fe}_2\text{O}_3(s) + 6\text{CO}(g) \rightarrow 4\text{Fe}(s) + 6\text{CO}_2(g)$ will be :- $(1) -112.4 \text{ kJ mol}^{-1}$  $(2) - 56.2 \text{ kJ mol}^{-1}$ (3) 168.2 kJ mol<sup>-1</sup> (4) 208.0 kJ mol<sup>-1</sup>

# **EXERCISE # (J-ADVANCE)**

Q.1 Using the data provided, calculate the multiple bond energy (kJ mol<sup>-1</sup>) of a C = C bond in C<sub>2</sub>H<sub>2</sub>. That energy is (take the bond energy of a C–H bond as 350 kJ mol<sup>-1</sup>.) [JEE 2012]

$2 C(s) + H_2(g) -$	$\longrightarrow C_2 H_2(g)$	$\Delta H = 225 \text{ kJ mol}^{-1}$	
2 C(s) -	$\longrightarrow 2C(g)$	$\Delta H = 1410 \text{ kJ mol}^{-1}$	
$H_2(g) -$	$\longrightarrow 2H(g)$	$\Delta H = 330 \text{ kJ mol}^{-1}$	
(A) 1165	(B) 837	(C) 865	(D) 815

Q.2. The standard enthalpies of formation of CO<sub>2</sub>(g), H<sub>2</sub>O(*l*) and glucose(s) at 25°C are -400 kJ/mol, -300 kJ/mol & -1300 kJ/mol, respectively. The standard enthalpy of combustion per gram of glucose at 25°C is - [JEE 2013]

 $(A) + 2900 \text{ kJ} \qquad (B) - 2900 \text{ kJ} \qquad (C) -16.11 \text{ kJ} \qquad (D) + 16.11 \text{ kJ}$ 

#### Paragraph For Questions 3 and 4

When 100 mL of 1.0 M HCl was mixed with 100 mL of 1.0 M NaOH in an insulated beaker at constant pressure, a temperature increase of 5.7 °C was measured for the beaker and its contents. (**Expt-1**). Because the enthalpy of neutralisation of a strong acid with a strong base is a constant ( $-57.0 \text{ kJmol}^{-1}$ ), this experiment could be used to measure the calorimeter constant. In a second experiment (**Expt-2**), 100 mL of 2.0 M acetic acid ( $K_a = 2.0 \times 10^{-5}$ ) was mixed with 100 mL of 1.0M NaOH (under identical conditions to (**Expt-1**)) where a temperature rise of 5.6 °C was measured. (Consider heat capacity of all solutions as 4.2 Jg<sup>-1</sup>K<sup>-1</sup> and density of all solutions as 1.0 g mL<sup>-1</sup>)

Q.3 Enthalpy of dissociation (in kJ mol<sup>-1</sup>) of acetic acid obtained from the **Expt-2** is

	(A) 1.0	(B) 10.0	(C) 24.5	(D) 51.4
Q.4	The pH of the solution	after Expt-2		
	(A) 2.8	(B) 4.7	(C) 5.0	(D) 7.0
