

ELECTROCHEMISTRY

ELECTRODE POTENTIAL

For any electrode $\rightarrow$ oxidation potential = – Reduction potential

$$E_{\text{cell}} = \text{R.P of cathode} - \text{R.P of anode}$$

$$E_{\text{cell}} = \text{R.P. of cathode} + \text{O.P of anode}$$

E_{cell} is always a +ve quantity & Anode will be electrode of low R.P

$$E^{\circ}_{\text{cell}} = \text{SRP of cathode} - \text{SRP of anode.}$$

- **Greater the SRP value greater will be oxidising power.**

GIBBS FREE ENERGY CHANGE :

$$\Delta G = - nFE_{\text{cell}}$$

$$\Delta G^{\circ} = - nFE^{\circ}_{\text{cell}}$$

NERNST EQUATION : (Effect of concentration and temp on emf of cell)

$$\Delta G = \Delta G^{\circ} + RT \ln Q \quad (\text{where } Q \text{ is reaction quotient})$$

$$\Delta G^{\circ} = - RT \ln K_{\text{eq}}$$

$$E_{\text{cell}} = E^{\circ}_{\text{cell}} - \frac{RT}{nF} \ln Q$$

$$E_{\text{cell}} = E^{\circ}_{\text{cell}} - \frac{2.303RT}{nF} \log Q$$

$$E_{\text{cell}} = E^{\circ}_{\text{cell}} - \frac{0.0591}{n} \log Q \quad [\text{At } 298 \text{ K}]$$

At chemical equilibrium

$$\Delta G = 0 \quad ; \quad E_{\text{cell}} = 0.$$

○
$$\log K_{\text{eq}} = \frac{nE^{\circ}_{\text{cell}}}{0.0591}.$$

$$E^{\circ}_{\text{cell}} = \frac{0.0591}{n} \log K_{\text{eq}}$$

For an electrode $M(s)/M^{n+}$.

$$E_{M^{n+}/M} = E^{\circ}_{M^{n+}/M} - \frac{2.303RT}{nF} \log \frac{1}{[M^{n+}]}.$$

CONCENTRATION CELL :

A cell in which both the electrodes are made up of same material.

For all concentration cell $E^{\circ}_{\text{cell}} = 0.$

- (a) **Electrolyte Concentration Cell :**
eg. $\text{Zn(s)} / \text{Zn}^{2+} (\text{c}_1) \parallel \text{Zn}^{2+} (\text{c}_2) / \text{Zn(s)}$

$$E = \frac{0.0591}{2} \log \frac{C_2}{C_1}$$

- (b) **Electrode Concentration Cell :**
eg. $\text{Pt, H}_2(\text{P}_1 \text{ atm}) / \text{H}^+ (1\text{M}) \parallel \text{H}_2 (\text{P}_2 \text{ atm}) / \text{Pt}$

$$E = \frac{0.0591}{2} \log \left(\frac{P_1}{P_2} \right)$$

DIFFERENT TYPES OF ELECTRODES :

1. Metal-Metal ion Electrode $\text{M(s)}/\text{M}^{n+}$. $\text{M}^{n+} + n\text{e}^- \longrightarrow \text{M(s)}$

$$E = E^\circ + \frac{0.0591}{n} \log [\text{M}^{n+}]$$

2. Gas-ion Electrode $\text{Pt}/\text{H}_2(\text{Patm})/\text{H}^+ (\text{XM})$
as a reduction electrode

$$E = E^\circ - 0.0591 \log \frac{P_{\text{H}_2}^{\frac{1}{2}}}{[\text{H}^+]}$$

3. Oxidation-reduction Electrode $\text{Pt} / \text{Fe}^{2+}, \text{Fe}^{3+}$
as a reduction electrode $\text{Fe}^{3+} + \text{e}^- \longrightarrow \text{Fe}^{2+}$

$$E = E^\circ - 0.0591 \log \frac{[\text{Fe}^{2+}]}{[\text{Fe}^{3+}]}$$

4. Metal-Metal insoluble salt Electrode eg. $\text{Ag}/\text{AgCl}, \text{Cl}^-$
as a reduction electrode $\text{AgCl(s)} + \text{e}^- \longrightarrow \text{Ag(s)} + \text{Cl}^-$

$$E_{\text{Cl}^- / \text{AgCl} / \text{Ag}} = E_{\text{Cl}^- / \text{AgCl} / \text{Ag}}^\circ - 0.0591 \log [\text{Cl}^-].$$

ELECTROLYSIS :

- (a) $\text{K}^+, \text{Ca}^{+2}, \text{Na}^+, \text{Mg}^{+2}, \text{Al}^{+3}, \text{Zn}^{+2}, \text{Fe}^{+2}, \text{H}^+, \text{Cu}^{+2}, \text{Ag}^+, \text{Au}^{+3}.$

$\xrightarrow{\hspace{10em}}$
 Increasing order of deposition.

- (b) Similarly the anion which is stronger reducing agent (low value of SRP) is liberated first at the anode.

$\xrightarrow{\text{SO}_4^{2-}, \text{NO}_3^-, \text{OH}^-, \text{Cl}^-, \text{Br}^-, \text{I}^-}$
 Increasing order of deposition

FARADAY'S LAW OF ELECTROLYSIS :

First Law :

$$w = zq$$

$$w = Z it \quad Z = \text{Electrochemical equivalent of substance}$$

Second Law :

$$W \propto E \quad \frac{W}{E} = \text{constant} \quad \frac{W_1}{E_1} = \frac{W_2}{E_2} = \dots\dots\dots$$
$$\frac{W}{E} = \frac{i \times t \times \text{current efficiency factor}}{96500}.$$

$$\text{Current efficiency} = \frac{\text{actual mass deposited/produced}}{\text{Theoretical mass deposited/produced}} \times 100$$

CONDITION FOR SIMULTANEOUS DEPOSITION OF Cu & Fe AT CATHODE

$$E^\circ_{\text{Cu}^{2+}/\text{Cu}} - \frac{0.0591}{2} \log \frac{1}{\text{Cu}^{2+}} = E^\circ_{\text{Fe}^{2+}/\text{Fe}} - \frac{0.0591}{2} \log \frac{1}{\text{Fe}^{2+}}$$

Condition for the simultaneous deposition of Cu & Fe on cathode.

CONDUCTANCE :

☞ $\text{Conductance} = \frac{1}{\text{Resistance}}$

☞ Specific conductance or conductivity :

(Reciprocal of specific resistance) $K = \frac{1}{\rho}$

K = specific conductance

☞ Equivalent conductance :

$$\lambda_E = \frac{K \times 1000}{\text{Normality}} \quad \text{unit : } \text{-ohm}^{-1} \text{ cm}^2 \text{ eq}^{-1}$$

☞ Molar conductance :

$$\lambda_m = \frac{K \times 1000}{\text{Molarity}} \quad \text{unit : } \text{-ohm}^{-1} \text{ cm}^2 \text{ mole}^{-1}$$

$$\text{specific conductance} = \text{conductance} \times \frac{\ell}{a}$$

KOHLRAUSCH'S LAW :

Variation of λ_{eq} / λ_m of a solution with concentration :

(i) Strong electrolyte

$$\lambda_M^c = \lambda_M^\infty - b\sqrt{c}$$

(ii) Weak electrolytes : $\lambda_\infty = n_+ \lambda_+^\infty + n_- \lambda_-^\infty$

where λ is the molar conductivity

n_+ = No of cations obtained after dissociation per formula unit

n_- = No of anions obtained after dissociation per formula unit

APPLICATION OF KOHLRAUSCH LAW :

1. Calculation of λ_M^0 of weak electrolytes :

$$\lambda_{M(CH_3COOH)}^0 = \lambda_{M(CH_3COONa)}^0 + \lambda_{M(HCl)}^0 - \lambda_{M(NaCl)}^0$$

2. To calculate degree of dissociation of a weak electrolyte

$$\alpha = \frac{\lambda_m^c}{\lambda_m^0} ; \quad K_{eq} = \frac{c\alpha^2}{(1-\alpha)}$$

3. Solubility (S) of sparingly soluble salt & their K_{sp}

$$\lambda_M^c = \lambda_M^\infty = \kappa \times \frac{1000}{\text{solubility}}$$

$$K_{sp} = S^2.$$

Transport Number :

$$t_c = \left[\frac{\mu_c}{\mu_c + \mu_a} \right], \quad t_a = \left[\frac{\mu_a}{\mu_a + \mu_c} \right].$$

Where t_c = Transport Number of cation & t_a = Transport Number of anion
