# **Exponents and Powers**

Chapter 11

#### 11.1 Introduction

#### Do you know?

Mass of earth is 5,970,000,000,000, 000, 000, 000, 000 kg. We have already learnt in earlier class how to write such large numbers more conveniently using exponents, as,  $5.97 \times 10^{24}$  kg.

We read  $10^{24}$  as 10 raised to the power 24.

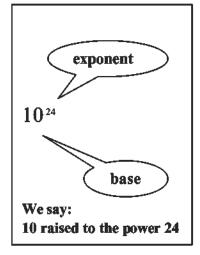

We know

$$2^5 = 2 \times 2 \times 2 \times 2 \times 2$$

and

$$2^{m} = 2 \times 2 \times 2 \times 2 \times \dots \times 2 \times 2 \dots (m \text{ times})$$

Let us now find what is  $2^{-2}$  is equal to?

#### 11.2 Powers with Negative Exponents

You know that,

$$10^2 = 10 \times 10 = 100$$

$$10^1 = 10 = \frac{100}{10}$$

$$10^0 = 1 = \frac{10}{10}$$

$$10^{-1} = ?$$

Exponent is a negative integer

Continuing the above pattern we get,  $10^{-1} = \frac{1}{10}$ 

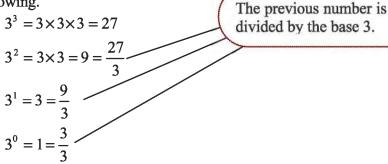

Similarly

$$10^{-2} = \frac{1}{10} + 10 = \frac{1}{10} \times \frac{1}{10} = \frac{1}{100} = \frac{1}{10^2}$$

$$10^{-3} = \frac{1}{100} \div 10 = \frac{1}{100} \times \frac{1}{10} = \frac{1}{1000} = \frac{1}{10^3}$$

What is  $10^{-10}$  equal to?

Now consider the following.

So looking at the above pattern, we say

$$3^{-1} = 1 \div 3 = \frac{1}{3}$$
$$3^{-2} = \frac{1}{3} \div 3 = \frac{1}{3 \times 3} = \frac{1}{3^{2}}$$
$$3^{-3} = \frac{1}{3^{2}} \div 3 = \frac{1}{3^{2}} \times \frac{1}{3} = \frac{1}{3^{3}}$$

You can now find the value of  $2^{-2}$  in a similar manner.

We have, 
$$10^{-2} = \frac{1}{10^{2}} \quad \text{or} \quad 10^{2} = \frac{1}{10^{-2}}$$

$$10^{-3} = \frac{1}{10^{3}} \quad \text{or} \quad 10^{3} = \frac{1}{10^{-3}}$$

$$3^{-2} = \frac{1}{3^{2}} \quad \text{or} \quad 3^{2} = \frac{1}{3^{-2}}$$

In general, we can say that for any non-zero integer a,  $a^{-m} = \frac{1}{a^m}$ , where m is a positive integer.  $a^{-m}$  is the multiplicative inverse of  $a^{m}$ .

#### TRY THESE

Find the multiplicative inverse of the following.

(i) 
$$2^{-4}$$

(ii) 
$$10^{-5}$$

(iii) 
$$7^{-2}$$

(iv) 
$$5^{-3}$$

(iii) 
$$7^{-2}$$
 (iv)  $5^{-3}$  (v)  $10^{-100}$ 

We learnt how to write numbers like 1425 in expanded form using exponents as  $1 \times 10^3 + 4 \times 10^2 + 2 \times 10^1 + 5 \times 10^0$ .

Let us see how to express 1425.36 in expanded form in a similar way.

We have 
$$1425.36 = 1 \times 1000 + 4 \times 100 + 2 \times 10 + 5 \times 1 + \frac{3}{10} + \frac{6}{100}$$
  
=  $1 \times 10^3 + 4 \times 10^2 + 2 \times 10 + 5 \times 1 + 3 \times 10^{-1} + 6 \times 10^{-2}$ 

$$\boxed{10^{-1} = \frac{1}{10}, 10^{-2} = \frac{1}{10^2} = \frac{1}{100}}$$

#### TRY THESE

Expand the following numbers using exponents.

- (i) 1025.63
- (ii) 1256.249

## 11.3 Laws of Exponents

We have learnt that for any non-zero integer a,  $a^m \times a^n = a^{m+n}$ , where m and n are natural numbers. Does this law also hold if the exponents are negative? Let us explore.

We know that  $2^{-3} = \frac{1}{2^3}$  and  $2^{-2} = \frac{1}{2^2}$ (i)

 $a^{-m} = \frac{1}{a^m} \text{ for any non - zero integer a}$ 

Therefore,  $2^{-3} \times 2^{-2} = \frac{1}{2^3} \times \frac{1}{2^2} = \frac{1}{2^3 \times 2^2} = \frac{1}{2^{3+2}} = 2^{-5}$ 

Take  $(-3)^{-4} \times (-3)^{-3}$ (ii)

$$(-3)^{-4} \times (-3)^{-3} = \frac{1}{(-3)^4} \times \frac{1}{(-3)^3}$$

-5 is the sum of two exponents -3 and -2

$$= \frac{1}{(-3)^4 \times (-3)^3} = \frac{1}{(-3)^{4+3}} = (-3)^{-7} \qquad (-4) + (-3) = -7$$

Now consider  $5^{-2} \times 5^4$   $5^{-2} \times 5^4 = \frac{1}{5^2} \times 5^4 = \frac{5^4}{5^2} = 5^{4-2} = 5^{(2)}$ In Class VII, you have learnt that for any non-zero integer a,  $\frac{a^m}{a^n} = a^{m-n}$ , where m and n are (iii)

$$\frac{a^m}{a^n} = a^{m-n}$$
, where m and n are

natural numbers and m > n.

Now consider  $(-5)^{-4} \times (-5)^2$ (iv)

> $(-5)^{-4} \times (-5)^2 = \frac{1}{(-5)^4} \times (-5)^2 = \frac{(-5)^2}{(-5)^4} = \frac{1}{(-5)^4 \times (-5)^{-2}}$  $=\frac{1}{(-5)^{4-2}}=(-5)^{-(2)} \qquad (-4)+2=-2$

In general, we can say that for any non-zero integer a,  $a^m \times a^n = a^{m+n}$ , where m and n are integers.

#### TRY THESE

Simplify and write in exponential form.

- (i)  $(-2)^{-3} \times (-2)^{-4}$
- (ii)  $p^3 \times p^{-10}$  (iii)  $3^2 \times 3^{-5} \times 3^6$

These laws you

have studied in Class VII for positive exponents

194

On the same lines you can verify the following laws of exponents, where a and b are non-zero integers and m, n are any integers.

- (i)  $\frac{a^m}{a^n} = a^{m-n}$  (ii)  $(a^m)^n = a^{mn}$  (iii)  $a^m \times b^m = (ab)^m$ (iv)  $\frac{a^m}{b^m} = \left(\frac{a}{b}\right)^m$  (v)  $a^0 = 1$

Let us solve some examples using the above Laws of Exponents.

**Example 1:** Find the value of

(i) 
$$2^{-3}$$

(ii) 
$$\frac{1}{3^{-2}}$$

Solution:

(i) 
$$2^{-3} = \frac{1}{2^3} = \frac{1}{8}$$

(i) 
$$2^{-3} = \frac{1}{2^3} = \frac{1}{8}$$
 (ii)  $\frac{1}{3^{-2}} = 3^2 = 3 \times 3 = 9$ 

Example 2: Simplify

(i) 
$$(-4)^5 \times (-4)^{-10}$$

(ii) 
$$2^5 \div 2^{-6}$$

Solution:

(i) 
$$(-4)^5 \times (-4)^{-10} = (-4)^{(5-10)} = (-4)^{-5} = \frac{1}{(-4)^5}$$
  $(a^m \times a^n = a^{m+n}, a^{-m} = \frac{1}{a^m})$ 

$$(a^m \times a^n = a^{m+n}, a^{-m} = \frac{1}{a^m})$$

(ii) 
$$2^5 \div 2^{-6} = 2^{5-(-6)} = 2^{11}$$
  $(a^m \div a^n = a^{m-n})$ 

$$(a^m \div a^n = a^{m-n})$$

**Example 3:** Express  $4^{-3}$  as a power with the base 2.

**Solution:** We have,  $4 = 2 \times 2 = 2^2$ 

Therefore, 
$$(4)^{-3} = (2 \times 2)^{-3} = (2^2)^{-3} = 2^{2 \times (-3)} = 2^{-6}$$
  $[(a^m)^n = a^{mn}]$ 

**Example 4:** Simplify and write the answer in the exponential form.

(i) 
$$(2^5 \div 2^8)^5 \times 2^{-5}$$

(ii) 
$$(-4)^{-3} \times (5)^{-3} \times (-5)^{-3}$$

(iii) 
$$\frac{1}{8} \times (3)^{-3}$$

(iv) 
$$(-3)^4 \times \left(\frac{5}{3}\right)^4$$

Solution:

(i) 
$$(2^5 \div 2^8)^5 \times 2^{-5} = (2^{5-8})^5 \times 2^{-5} = (2^{-3})^5 \times 2^{-5} = 2^{-15-5} = 2^{-20} = \frac{1}{2^{20}}$$

(ii) 
$$(-4)^{-3} \times (5)^{-3} \times (-5)^{-3} = [(-4) \times 5 \times (-5)]^{-3} = [100]^{-3} = \frac{1}{100^3}$$

[using the law 
$$a^{m} \times b^{m} = (ab)^{m}, a^{-m} = \frac{1}{a^{m}}$$
]

(iii) 
$$\frac{1}{8} \times (3)^{-3} = \frac{1}{2^3} \times (3)^{-3} = 2^{-3} \times 3^{-3} = (2 \times 3)^{-3} = 6^{-3} = \frac{1}{6^3}$$

(iv) 
$$(-3)^4 \times \left(\frac{5}{3}\right)^4 = (-1 \times 3)^4 \times \frac{5^4}{3^4} = (-1)^4 \times 3^4 \times \frac{5^4}{3^4}$$
  
=  $(-1)^4 \times 5^4 = 5^4 \quad [(-1)^4 \times 1]$ 

**Example 5:** Find m so that  $(-3)^{m+1} \times (-3)^5 = (-3)^7$ 

**Solution:** 
$$(-3)^{m+1} \times (-3)^5 = (-3)^7$$

$$(-3)^{m+1+5} = (-3)^7$$
  
 $(-3)^{m+6} = (-3)^7$ 

On both the sides powers have the same base different from 1 and -1, so their exponents must be equal.

Therefore, m + 6 = 7m = 7 - 6 = 1OΓ

**Solution:**  $\left(\frac{2}{3}\right)^{-2} = \frac{2^{-2}}{3^{-2}} = \frac{3^2}{2^2} = \frac{9}{4}$ 

Example 7: Simplify (i)  $\left\{ \left( \frac{1}{3} \right)^{-2} - \left( \frac{1}{2} \right)^{-3} \right\} \div \left( \frac{1}{4} \right)^{-2}$  (ii)  $\left( \frac{5}{8} \right)^{-7} \times \left( \frac{8}{5} \right)^{-5}$  In general,  $\left( \frac{a}{b} \right)^{-m} = \left( \frac{b}{a} \right)^{m}$ 

(ii) 
$$\left(\frac{5}{8}\right)^{-7} \times \left(\frac{8}{5}\right)^{-5}$$

 $a^n = 1$  only if n = 0. This will work for any a except a = 1 or a = -1. For a = 1, 11 = 1<sup>2</sup> = 1<sup>3</sup> $= 1^{-2} = ... = 1$  or  $(1)^n = 1$  for infinitely many n. Example 6: Find the value of  $\left(\frac{2}{3}\right)^{-2}$ .

For a = -1,  $(-1)^0 = (-1)^2 = (-1)^4 = (-1)^{-2} = ... = 1$  or  $(-1)^p = 1$  for any even integer p.

$$\left(\frac{2}{3}\right)^{-2} = \frac{2^{-2}}{3^{-2}} = \frac{3^2}{2^2} = \left(\frac{3}{2}\right)^2$$
In general,  $\left(\frac{a}{b}\right)^{-m} = \left(\frac{b}{a}\right)^m$ 

**Solution:** 

(i) 
$$\left\{ \left( \frac{1}{3} \right)^{-2} - \left( \frac{1}{2} \right)^{-3} \right\} \div \left( \frac{1}{4} \right)^{-2} = \left\{ \frac{1^{-2}}{3^{-2}} - \frac{1^{-3}}{2^{-3}} \right\} \div \frac{1^{-2}}{4^{-2}}$$
  
$$= \left\{ \frac{3^2}{1^2} - \frac{2^3}{1^3} \right\} \div \frac{4^2}{1^2} = \left\{ 9 - 8 \right\} \div 16 = \frac{1}{16}$$

(ii) 
$$\left(\frac{5}{8}\right)^{-7} \times \left(\frac{8}{5}\right)^{-5} = \frac{5^{-7}}{8^{-7}} \times \frac{8^{-5}}{5^{-5}} = \frac{5^{-7}}{5^{-5}} \times \frac{8^{-5}}{8^{-7}} = 5^{(-7) - (-5)} \times 8^{(-5) - (-7)}$$
$$= 5^{-2} \times 8^2 = \frac{8^2}{5^2} = \frac{64}{25}$$

## Exercise 11.1

- Evaluate. 1.

  - (i)  $3^{-2}$  (ii)  $(-4)^{-2}$
- 2. Simplify and express the result in power notation with positive exponent.
  - (i)  $(-4)^5 + (-4)^8$  (ii)  $\left(\frac{1}{2^3}\right)^2$

  - (iii)  $(-3)^4 \times \left(\frac{5}{3}\right)^4$  (iv)  $(3^{-7} \div 3^{-10}) \times 3^{-5}$  (v)  $2^{-3} \times (-7)^{-3}$
- 3. Find the value of.
- (i)  $(3^{0} + 4^{-1}) \times 2^{2}$  (ii)  $(2^{-1} \times 4^{-1}) \div 2^{-2}$  (iii)  $(\frac{1}{2})^{-2} + (\frac{1}{3})^{-2} + (\frac{1}{4})^{-2}$

(iv) 
$$(3^{-1} + 4^{-1} + 5^{-1})^0$$
 (v)  $\left\{ \left( \frac{-2}{3} \right)^{-2} \right\}^2$   
Evaluate (i)  $\frac{8^{-1} \times 5^3}{2^{-4}}$  (ii)  $(5^{-1} \times 2^{-1}) \times 6^{-1}$ 

- 4.
- Find the value of m for which  $5^m \div 5^{-3} = 5^5$ . 5.
- Evaluate (i)  $\left\{ \left(\frac{1}{3}\right)^{-1} \left(\frac{1}{4}\right)^{-1} \right\}^{-1}$  (ii)  $\left(\frac{5}{8}\right)^{-7} \times \left(\frac{8}{5}\right)^{-4}$ 6.
- 7. Simplify

(i) 
$$\frac{25 \times t^{-4}}{5^{-3} \times 10 \times t^{-8}} (t \neq 0)$$

(ii) 
$$\frac{3^{-5} \times 10^{-5} \times 125}{5^{-7} \times 6^{-5}}$$

# 11.4 Use of Exponents to Express Small Numbers in Standard Form

Observe the following facts.

- 1. The distance from the Earth to the Sun is 149,600,000,000 m.
- The speed of light is 300,000,000 m/sec. 2.
- 3. Thickness of Class VII Mathematics book is 20 mm.
- 4. The average diameter of a Red Blood Cell is 0.000007 mm.
- 5. The thickness of human hair is in the range of 0.005 cm to 0.01 cm.
- The distance of moon from the Earth is 384, 467, 000 m (approx). 6.
- 7. The size of a plant cell is 0.00001275 m.
- 8. Average radius of the Sun is 695000 km.
- 9. Mass of propellant in a space shuttle solid rocket booster is 503600 kg.
- 10. Thickness of a piece of paper is 0.0016 cm.
- 11. Diameter of a wire on a computer chip is 0.000003 m.
- 12. The height of Mount Everest is 8848 m.

Observe that there are few numbers which we can read like 2 cm, 8848 m, 6, 95, 000 km. There are some large numbers like 150,000,000,000 m and some very small numbers like 0.000007 m.

Identify very large and very small numbers from the above facts and write them in the adjacent table:

Very small numbers
0.000007 m

We have learnt how to express very large numbers in standard form in the previous class.

For example:  $150.000,000,000 = 1.5 \times 10^{11}$ 

Now, let us try to express 0.000007 m in standard form.

$$0.000007 = \frac{7}{1000000} = \frac{7}{10^6} = 7 \times 10^{-6}$$

1500000000000. Decimal is moved 11 places to the left.

0.0000007 m = 7×10-6 m

Similarly, consider the thickness of a piece of paper which is 0.0016 cm.

$$0.0016 = \frac{16}{10000} = \frac{1.6 \times 10}{10^4} = 1.6 \times 10 \times 10^{-4}$$

Therefore, we can say thickness of paper is 1.6×10-2 cm.

0.000007 deciral is moved 6 places to the right.

Again notice

0.0016 decimal is moved

12.3 3 places to the right

#### TRY THESE

Write the following numbers in standard form.

(i) 0.000000564

(ii) 0.0000021

(iii) 21600000

(iv) 15240000

2. Write all the facts given in the standard form.

# 11.4.1 Comparing very large and very small numbers

The diameter of the Sun is  $1.4 \times 10^9$  m and the diameter of the Earth is  $1.2756 \times 10^7$  m. Suppose you want to compare the diameter of the Earth, with the diameter of the Sun.

Dismeter of the Sun = 1.4 × 10 m

Diameter of the earth =  $1.2756 \times 10^7$  m

Therefore 
$$\frac{1.4 \times 10^9}{1.2756 \times 10^7} = \frac{1.4 \times 10^{9-7}}{1.2756} = \frac{1.4 \times 100}{1.2756}$$
 which is approximately 100

So, the diameter of the Sun is about 100 times the diameter of the earth.

Let us compare the size of a Red Blood cell which is 0.000007 m to that of a plant cell which is 0.00001275 m.

Size of Red Blood cell = 
$$0.000007 \text{ m} = 7 \times 10^{-6} \text{ m}$$
  
Size of plant cell =  $0.00001275 = 1.275 \times 10^{-5} \text{ m}$ 

Therefore, 
$$\frac{7 \times 10^{-6}}{1.275 \times 10^{-6}} = \frac{7 \times 10^{-6-(-5)}}{1.275} = \frac{7 \times 10^{-1}}{1.275} = \frac{0.7}{1.275} = \frac{0.7}{1.3} = \frac{1}{2}$$
 (approximately)

So a red blood cell is half of plant cell in size.

Mass of earth is  $5.97 \times 10^{24}$  kg and mass of muon is  $7.35 \times 10^{22}$  kg. What is the total mass?

Total mass = 
$$5.97 \times 10^{24}$$
 kg +  $7.35 \times 10^{22}$  kg =  $5.97 \times 100 \times 10^{21} + 7.35 \times 10^{22}$  =  $5.97 \times 10^{22} + 7.35 \times 10^{22}$  =  $(597 + 7.35) \times 10^{22}$  =  $604.35 \times 10^{22}$  kg.

When we have to add numbers in standard form, we convert them into numbers with the same exponents.

The distance between Sun and Earth is 1,496 × 10 12 m and the distance between

Earth and Moon is 3.84 × 10 m.

During solar eclipse moon comes in between Earth and Sun.

At that time what is the distance between Moon and Sun.

Distance between Sun and Earth = 
$$1.496 \times 10^{11}$$
 m  
Distance between Earth and Moon =  $3.84 \times 10^{8}$  m  
Distance between Sun and Moon =  $1.496 \times 10^{11} - 3.84 \times 10^{8}$   
=  $1.496 \times 1000 \times 10^{8} - 3.84 \times 10^{8}$   
=  $(1496 - 3.84) \times 10^{8}$  m =  $1492.16 \times 10^{8}$  m

**Example 8:** Express the following numbers in standard form.

- (i) 0.000035
- (ii) 4050000

#### Solution:

- (i)  $0.000035 = 3.5 \times 10^{-5}$
- (ii)  $4050000 = 4.05 \times 10^6$

**Example 9:** Express the following numbers in usual form.

- (i)  $3.52 \times 10^5$
- (ii)  $7.54 \times 10^{-4}$
- (iii)  $3 \times 10^{-5}$

Solution:

- (i)  $3.52 \times 10^5 = 3.52 \times 100000 = 352000$
- (ii)  $7.54 \times 10^{-4} = \frac{7.54}{10^4} = \frac{7.54}{10000} = 0.000754$
- (iii)  $3 \times 10^{-5} = \frac{3}{10^{5}} = \frac{3}{100000} = 0.00003$

Again we need to convert numbers in standard form into a numbers with the same exponents.

#### Exercise 11.2

- 1. Express the following numbers in standard form.
  - (i) 0.000000000085
- (ii) 0.0000000000942
- (iii) 60200000000000000
- (iv) 0.0000000837

- (v) 31860000000
- 2. Express the following numbers in usual form.
  - (i)  $3.02 \times 10^{-6}$  (ii)  $4.5 \times 10^{4}$
- (iii)  $3 \times 10^{-8}$
- (iv)  $1.0001 \times 10^9$  (v)  $5.8 \times 10^{12}$
- (vi)  $3.61492 \times 10^6$
- 3. Express the number appearing in the following statements in standard form.
  - (i) 1 micron is equal to  $\frac{1}{1000000}$  m.
  - (ii) Charge of an electron is 0.000,000,000,000,000,000,16 coulomb.
  - (iii) Size of a bacteria is 0.0000005 m
  - (iv) Size of a plant cell is 0.00001275 m
  - (v) Thickness of a thick paper is 0.07 mm

4. In a stack there are books each of thickness 20mm and 5 paper sheets each of thickness 0.016 mm. What is the total thickness of the stack.

#### MISCELLANEOUS EXERCISE 11:

Example 1: Write in expanded form using exponents

- (i) 2030.00201
- (ii) 1002.01002

**Example 2:** Find 'm' so that  $\left(\frac{-2}{3}\right)^{2m-1} \div \left(\frac{-2}{3}\right)^{-2} = \frac{4}{9} \left(\frac{-2}{3}\right)^{3}$ 

Example 3: Simplify  $\left(\frac{3}{4}\right)^{-2} - \left(\frac{3}{4}\right)^{-2} + \left(\frac{3}{4}\right)^{-3} - \left(\frac{3}{4}\right)^{-3}$ 

Example 4: Write in standard form

- (i)  $0.0007 \times 10^{-3}$
- (ii) 4235.678

Example 5: The diameter of a space is 2.25 × 10<sup>6</sup> meters and diameter of another sphere is

 $1.5 \times 10^4$  meters. Find the ratio of the two diameters. How many times the diameter of the first is greater than the diameter of second sphere?

**Example 6:** Add  $2.203 \times 10^{27} + 3.312 \times 10^{24}$ 

**Example 7:** Subtract  $1.002 \times 10^9 - 2.34 \times 10^7$ 

Example 8: Simplify  $\frac{7 \times 10^{-4} + 6 \times 10^{-5} + (2.6) \times 10^{-5}}{10^{-3} + 2 \times 10^{-4} + (1.1) \times 10^{-4}}$ 

Example 9: Fill in the blanks

- (i)  $a^m \div a^n =$
- (ii)  $(a^m)^n = \underline{\hspace{1cm}}$
- (iii)  $\left\{ \left( \frac{2}{3} \right)^{-1} + \frac{3}{2} \right\}^{0} + (-1)^{2} = \underline{\hspace{1cm}}$
- (iv)  $5^3 5^3 \div 5^2 5^2 =$ (v)  $0.0000423 = 4.23 \times 10^{---}$

**Example 10:** Simplify

- (i)  $\left(\frac{1}{-4}\right)^2 (-4)^{-2}$  (ii)  $(3^{-3} \div 3^{-5}) \times 3^{-2}$  (iii)  $1^0 + 2^1 + 3^2$  (iv)  $1^0 + 2^{-2} + 3^{-2}$  (v)  $(-1)^{-3} \left(\frac{1}{2}\right)^{-2} + \left(\frac{1}{3}\right)^{-3}$

# What Have We Discussed

1. Numbers with negative exponents obey the following laws of exponents.

(a) 
$$a^m \times a^n = a^{m+n}$$

(b) 
$$a^m + a^n = a^{m-n}$$

(c) 
$$(a^m)^n = a^{mn}$$

(d) 
$$a^m \times b^m = (ab)^m$$
 (e)  $a^0 = 1$ 

(e) 
$$a^0 = 1$$

(f) 
$$\frac{a^m}{b^m} = \left(\frac{a}{b}\right)^n$$

Very small numbers can be expressed in standard form using negative exponents. 2.
