- You have to evaluate your Response Grids yourself with the help of solution booklet.
- Each correct answer will get you 4 marks and 1 mark shall be deducted for each incorrect answer. No mark will be given/ deducted if no bubble is filled. Keep a timer in front of you and stop immediately at the end of 60 min.
- The sheet follows a particular syllabus. Do not attempt the sheet before you have completed your preparation for that syllabus. Refer syllabus sheet in the starting of the book for the syllabus of all the DPP sheets.
- After completing the sheet check your answers with the solution booklet and complete the Result Grid. Finally spend time to analyse your performance and revise the areas which emerge out as weak in your evaluation.

- (15) (c) In Kolbe's synthesis, sodium or potassium salt of malic acid or fumaric acid on electrolysis gives acetylene or ethyne at anode.

- (16) (c) The order of acidity of H_2O , NH_3 and acetylene depends upon the relative basicity of $\text{OH}^\ominus$, $\text{NH}_2^\ominus$ and $\text{HC}\equiv\text{C}^\ominus$. The decreasing nature of basic character is $\text{NH}_2^\ominus > \text{HC}\equiv\text{C}^\ominus > \text{OH}^\ominus$, hence the decreasing order of acidity is $\text{H}_2\text{O} > \text{HC}\equiv\text{CH} > \text{NH}_3$.

- (23) (a) Potassium fumarate on electrolysis, CaC_2 on hydrolysis and ethylene bromide on elimination give acetylene. Aluminium carbide on hydrolysis produces methane.

- (25) (d) Acetylene contains two acidic hydrogen atoms.

(26) (a)

- (27) (a) $\text{AgC} \equiv \text{CAg}$ is white and $\text{CuC} \equiv \text{CCu}$ is red.

(28) (d)

- (29) (a) The low reactivity of alkynes towards electrophilic addition reactions is believed to be due to following two factors.

- (1) The bridged intermediate cation formed by the initial attack of electrophile on the triple bond is less stable because it is a highly strained system.
- (2) In acetylenic carbon atoms, the π electrons are more tightly held by the carbon nuclei and hence they are less easily available for reaction with electrophiles.

Thus both the above factors, steric and electronic, play their part in diminishing the reactivity of alkynes towards electrophiles.
