GENERAL INSTRUCTIONS

- The Daily Practice Problem Sheet contains 30 MCQ's. For each question only one option is correct. Darken the correct circle/bubble in the Response Grid provided on each page.
- You have to evaluate your Response Grids yourself with the help of solution booklet.
- Each correct answer will get you 4 marks and 1 mark shall be deducted for each incorrect answer. No mark will be given/ deducted if no bubble is filled. Keep a timer in front of you and stop immediately at the end of 60 min.
- The sheet follows a particular syllabus. Do not attempt the sheet before you have completed your preparation for that syllabus. Refer syllabus sheet in the starting of the book for the syllabus of all the DPP sheets.
- After completing the sheet check your answers with the solution booklet and complete the Result Grid. Finally spend time to analyse your performance and revise the areas which emerge out as weak in your evaluation.

(4) Methanol does not undergo iodoform reaction.

For Q.25-27

Before answering these question let us complete the sequence of reactions given in data.

The given compound (M),

is the only product formed by the action of KOH on compound K.

Thus compound K should be $\text{Ph} - \underset{\text{CH}_3}{\text{C}} = \bullet$

Compound K (i.e. $\text{Ph} - \underset{\text{CH}_3}{\text{C}} = \text{O}$) is one of the products

of ozonolysis of compound I. Therefore, the compound I may be

Thus compound J seems to be $\text{C}_6\text{H}_5\text{CHO}$.

Now, we will try to answer the questions.

25. (b) As can be seen from above reaction sequence compound (I) is $\text{Ph} - \text{CH} = \underset{\text{CH}_3}{\text{C}} - \text{Ph}$ and it is formed

by catalytic dehydration (acid catalysed) of a tertiary alcohol (compound H). Therefore, compound H is

(H) can be formed by the action of PhCOCH_3 with PhCH_2MgBr as follows

26. (a) As can be seen from the above sequence of reactions

27. (d) As can be seen from the above sequence of reactions the structures of compounds J, K and L respectively are

28. (b) The tendency to show H-bonding decreases with increasing hydrophobic character of carbon chain. The hydrophobic character of carbon chain increases with the length of carbon chain.
29. (b) Alcohols which form the more stable carbocations undergo dehydration more readily. Since *tert-butyl* alcohol forms more stable *tert-butyl* cation, therefore, it undergoes dehydration more readily than propanol.
30. (a) VictorMeyers test is used to distinguish primary, secondary and tertiary alcohols.
